up and down (which works in realtime) and it worked more or less as
quickly as it usually does.
(The same thing goes for the "Xcontrol" (CPX module control panel)
where the CPXes can be scrolled up and down- this seemed to work more
or less at the same speed as it usually does, but selecting and using
the CPX modules were slowed down).

-what slows down is: selecting "buttons" in windows
selecting any sort of icon/filename in the desktop
selecting any menu in desktop or program

By "slowing down" I mean;
-a button is clicked, but there's no response for quite some time
(from a few seconds (say 5 seconds) to maybe 10-15 seconds).
The button often turns black as it's selected, then closes the
window or whatever.

If I move the mouse pointer over to another menu, button or window, they keyclick will work as if I had clicked in that other window/menu/button.

-If I click outside a window, the system bell beeps some time after I've released the mouse-button. If I hold down the mouse button for a while it's still delayed, but the buffer seems to remember that I held it down for a while, so I get a long (continous) <beeeeeeeeeep>.

-a file is selected from the desktop, but nothing happens for a while.

-I window is moved, but if I get to "catch" the window, I see the "ghost image" of the window (the "transparent" window) and it (often) isn't released till after I stop moving the mouse and press the mouse button again.

That's all I can think of at the moment. Maybe this could give some hints to programmers or experienced users, what might be the problem. Could it really be some sort of virus? In a way I hope so, because that means I can probably get rid of it. I've been putting up with this sort of thing for quite some time now (over a year at least).

Timothy Miller (millert@csee.usf.edu) wrote:

: Hey, I'm kinda confused about something...

: the Falcon. After staring at it for a little while, I began to realize
: that the scanlines were not in fact being interlated at 60 fields per
: second, but instead were simply being ALTERLATED at 30 fps.

: WHAT'S THE DEAL? The Falcon doesn't really interlace! It just fakes it!

1. Interlaced video is composed of two fields of alternating scan lines, superimposed via the persistence of vision to create a single image.

2. NTSC television is interlaced. The phosphor of a television tube usually fades more slowly, resulting in greater persistence.

The gaps you are seeing between scan lines may be due to the adjustment of your monitor. If you can reduce the height of your image gradually, you should be able to make them disappear.

Sure you can. But hd-drivers that don't support the XHDI
protocol will ignore that partition, which is not what
you want. ;-)

> with a 256M minix partition or thereabouts.

Before switching to NetBSD/Atari I used to have 3 or 4 256MB minix v2
file systems. Worked fine for me (approx. 4KB per inode). Of course
it all depends on the size of the files, that will be stored on the
fs. For a /var/spool/ftp file system 20..40KB per inode will
probably be just fine, for a /var/spool/news fs OTOH this would
be quite unacceptable (unless it's for alt.binaries ;-)).

The next SwapMeet is Monday, February 5th, 1996.

WANTED: Dealers to sell at Upcoming Swap Meets. Dealerships sought fall into such Categories as Computer Dealers, all kinds. All kinds of Computer HardWare, SoftWare, Peripherals & Accessories for ALL Computer Makes and Types.

Also Sought are Dealers in Video Gaming Equipment, such as Video Game Consoles, Cartidges, Video Game CD Players and Video Game CDs. ALL Video Game Makes and Types. ALL Video Game Consoles, Cartridges, CDs, Peripherals & Accessories.

At Februarys SwapMeet do we have a SweetHeart of a deal for you! A Hewlett Packard Deskjet Printer offered as a Door Prize! Any one can win, just show up for the drawing!

Recruiting New Dealers with Membership for Dealer Value. You could setup at a full year of swapmeets, 12 Monthly swapmeets at $10 a Meet, for $120 a year, or join our group and setup ***FREE*** for a year for ONLY $50! Greater than a 50% Savings!

Also Wanted are Dealers in ALL Types of Electronics.

WANTED are Dealers in Ham Radio, CB Radio, Music CDs and other Recorded Music. Stereo Equipment also Wanted.

Also Wanted are VCR's, Video Tapes, TVs and Satelite Gear.

This is an ALL Computers, Game Machine and Electronics Swap Meet!!

Small Businesses, and Dealers Welcome and Wanted!!

NO ADMISSION CHARGE!!! PLENTY OF FREE PARKING!!! NO ADMISSION CHARGE!!!

TABLES $10! TABLES, FIRST COME, FIRST SERVE!

Swap Meet Location in Portland, Oregon. USA. At 1819 N.W. Everett St. at the NorthWest Service Center On the First Monday of each Month.

To find out about more about the Swap Meet call our 24 Hour Recorded info line at (503)650-7196 or for Live info, call from 3 PM - Midnight, Monday - Thursday, Friday 3 PM - 6 PM. Please call, especially dealers at: (503)256-9974 (VOICE/VOICE MESSAGING), leave your home number if Ben is not answering!

Source record: 152009

orendorf@upsilon.cs.fsu.edu (Jason Orendorf) spake thusly:

JO> I've been given a Mega STE (TOS 2.05) with 4MB of memory and
JO> no hard disk drive (or manuals). I know that it has a built
JO> in SCSI controller, so I tried connecting a Syquest SQ555
JO> removable HD (44MB per cartridge). During boot the drive
JO> didn't get recognized or even queried by the controller. The
JO> drive itself is a SCSI 1 device (id 2) and the cartridge was
JO> formatted under DOS (v 5.0). Seeing as I have *no* experience
JO> with using my new toy, I was wondering what it takes to get
JO> TOS to recognize a newly added device. Are there any DIPs to
JO> flip or special programs to run? I've tried GEM's "Install
JO> Device" option and manually installed an icon for drive C: to
JO> no avail. Does the disk need to be specially formatted?

Well, you need a hard disk driver. While I don't necessarily
recommend keeping it in use, I would grab ahdi3 (Atari Advanced Hard
Disk Utilities) or higher from the umich archives. If you do use
ahdi, your Syquest needs to be id 0; ahdi doesn't recognize drives
that are not sequentially numbered. Run ahdi.prg from the desktop,
install an icon for drive 'C', and then format/partition your disk,
using hdx.prg. You will then be in business. IIRC, there is a
lengthy text file in the ahdi files which tells you exactly what to
do. Since it is from Atari, it will leave plenty of questions
unanswered, but hey - that's what we're here for.

Somebody here may correct me, but I don't think you will be able to
read your DOS disk on the Atari.

VL> locker wasn't working on that particular day. Any help
VL> appreciated. vern

I'm not sure about this, but if you are talking about a SC1224 color monitor, and using Sebra for mono mode: IIRC, Sebra has a toggle for 50-60Hz mode. It will flicker in one of them. I've forgotten what keystroke it is. RTM.

1758. Warp 9 question

Newsgroup: comp.sys.atari.st
Date: 1996-01-27 00:00:00 UTC
From: tderrick@acpu.com
Message-ID: <960127000006262l9@acpu.com>
Source record: 152012

BM> From: gregor@shelly.goldengate.net (Bradly Maurer)

BM> came with W9 installed. I understand that it's a screen
BM> accelerator. But what else does it do?

Screen accelerator, screen saver, mouse accelerator, fastloader (PinHead code), desktop pictures and fills, desktop fonts, Function key equivalents for GEM alert boxes, and you can turn off the 'zoom boxes'. Version 3.75 does all the above.

BM> I have to admit that I
BM> really don't use it too often because it seems incompatible
BM> with most of the programs that I use. It crashes my version of
BM> Cubase and eliminates some of the graphic functions in my term
BM> programs. I use teddy term and FDZ. When using it with these I
BM> seem to unable to see the highlight bar or the bold/selected
BM> messages in pine on my server.

MIDI programs are pretty notorious for not getting along with auto folder/desk accessories. Both Flash and STorm dislike Warp9, so I'm not too surprised that yours don't. STalker works fine.

OTOH, I use Warp9 almost always. I junked some programs back when I got it, but they were minor - I've forgotten what they were.

BM> Any suggestions? I might use it
BM> a bit more often I knew exactly how to! I understand that you
BM> can get screensavers etc for it how does this work?

I bought 'Movies at Night' from Mountain Software, which can make animations that Warp9 will use as a screen saver. There is another one that I have not used. But Warp9 itself comes with about a dozen screensavers, file extender .ext (Extend-O-Save).

BM> It's that
BM> no documentation problem....

Well, there really isn't a substitute for the manual, but if you can find the Warp 9 Control Panel accessory, it would help a lot - both in explaining what it does, and in its use. Without it, Warp9 doesn't do much except the screen acceleration and a default screen saver.

1759. Mpeg fever and EB_Modeller

Newsgroup: comp.sys.atari.st
Date: 1996-01-27 00:00:00 UTC
From: wizzo@connexus.apana.org.au
Message-ID: <4ectnm$59m@preeda.internex.net.au>
Source record: 152013

Just a quick post to see if anyone can help me here. Having downloaded Mpeg fever and EB Modeller, and being unable to read the non-english documentation, I am in need of help. Both of these programs call external .TTP programs (POV, Encode), but in both of these programs I get 10 bombs when they attempt to run the external programs. The only thing that I could think of was that they require Mint/Multitos, but I'm really not sure. If anyone has these programs running successfully, could you please drop me a line and let me know if there are any special setup requirements.

Thanks for your help,

Jared

The actual routines themselves are in the ROMs. The trivial bit that I and
everyone else in the world except you call a library isn't.

>|There is a trap which switches based on an opcode, and draws things or
>|whatever. appl_init() is a C function which is contained in a library,
>|admittedly one whose main (not only in this case) is to jump through

> in the ROMS (despite what you might think) would be just silly.

Are you sure you can read? I just said appl_init() does a few things internally
and then jumps to a routine in the ROM. Nowhere did I say it duplicated
code in the ROMs.

>|You could write Windows programs without a library as well. So what?
>|
> Not really. Every ST/GEM1 API call is burned into ST mboards.
> The same is not true of wintel clones.

No, of course not, Windows is on disc, I think everyone realises that. But
we were talking about compiler support, and you do need libraries to
access either - what's the differemce?

>|Can't you read? He was quibbling with some of your examples, in particular

1762. Spectre problems

Newsgroup: comp.sys.atari.st
Date: 1996-01-27 00:00:00 UTC
From: Keith Joins <76702.375@CompuServe.COM>
Message-ID: <4ed2jicts1@mhadg.production.compuserve.com>
Source record: 152016

A couple of days ago I had a Mac program crash (it didn't crash Spectre, just the running application with a bomb message.) I tried to restart and couldn't so I pressed reset, re-ran Spectre, and have been having problems since. When I try and boot from the hard drive that contains System 6.0.4 I get the happy Mac face, my startup pic loads OK but after it loads the screen clears and returns to the question mark Mac. The first couple of times I tried this I also had a couple of other INITs load OK before things died. Now just the pic loads.

I figured that the System files or hard drive partition got trashed so I tried to boot from a Spectre format floppy (I have never been able to get the GCR to read Mac disks on either the internal or external floppy) that contains the System files. I get again the happy Mac and the first time got part of the Welcome to Macintosh display before the screen cleared and the A drive indicator started flashing. Now I just get the happy Mac followed shortly by the flashing A. I then formatted an MFS floppy, copied the System/Finder to an ST disk using Transverter, wrote boot blocks to the MFS floppy, and copied the System files back to the Spectre disk from the ST disk. Booting with this disk results in the same scenario. I can't use Trasverter on the hard drive as both Mac partitions are HFS.

Thinking there might be a problem with the GCR I switched the Mac ROMs to a Spectre cartridge. Same thing happens. I have also reloaded Spectre 3.0 from floppy, just in case :).

I have run out of ideas. Any other suggestions?

I have an ATARI 520STe but can't get the most out of it for lack of software - whether shareware or commercial - here in Singapore.

Any one knows whether there are any ATARI 520STE internet sites where I can d/l some software to use?

Thanks!

1766. Q: TOS 2.06 into 2 ROM 1040ST?/T-36 install

Newsgroup: comp.sys.atari.st
Date: 1996-01-27 00:00:00 UTC
From: Michael Grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <DLu7ov.K3r@ridgecrest.ca.us>
Source record: 152020

Greets,

I have a 1040STFM with the 2 ROM 1.02 set. I have installed
a Compatibility Plus 2.06 upgrade, and installed a
switch so I can still play GunShip and use GFA Raytrace :)

Now I am installing a T-36 (i'm bored) and was wondering
if I can just place the 2.06 ROMs into the old sockets?
The T-36 wouldn't run on top of the Compatibility Plus
and I did have the fast TOS jumper set, so I yanked out
the C/P upgrade.

I have installed sockets where the transparent latches go,
and am just waiting for the ALS versions to arrive so I can
run at 36mhz. Should I go ahead and replace the drivers
with the ALS type as well? Any more tricks anyone has
learned with the T-28/T36's?

Thank's for the help,

Mike

In article <199601270139.AA01552@moroder.demon.co.uk> robotron@moroder.demon.co.uk writes:
|In comp.sys.atari.st, scruggs@cis.ohio-state.edu (kevin eugene scruggs) wrote:
|In article <4eavt7$jvu@lyra.csx.cam.ac.uk| mnb20@cam.ac.uk (Mark Baker) writes:
|||No. NOWHERE in the ROMs does it know anything at all about appl_init().
|| Admittedly GEM itself knows nothing of the pnuemonic above.
|
|"Pnuemonic", you say. You've got a bloody cheek to suggest anybody needs to
|take remedial English classes, when you're barely literate yourself. Ohio
|State must really have gone to the dogs lately.
Spelling perhaps but the usage was perfectly consistent with CS
jargon even if a bit stretched. Your exposure of my inability to
spell all 100K of them is a victory for nitpicks everywhere...
|
|| However, function X in TRAP Y, is completely enumerated in
|| the TOS ROM. All any code need do is push the args to the
|| user stack, push X, push Y and call TRAP. GEM indeed does
|| the rest on it's own and that code is indeed burned into
|| the TOS ROM's and sits on the mboard of an ST.
|
|So basically your point is this: GEM is ROM-based, but Windows is disk-
|based. Thanks for bringing this to our attention; I'm sure nobody was aware
|of this absolute SCANDAL.
Well, there was at least someone who wasnt. The someone who brought
up the absurd notion of a ST C compilier without any GEMlibs. Next
we'll be discussing PC's that dont have any BIOS call support. '-p

|
|And to suggest that you could avoid the need for GEM libraries by using
|inline assembler is absolutely ludicrous. You could do the same with
|Windows if you could really be bothered. So what's your point?

You'd have to know where they are. 80x86 is a bit nasty as assembly
goes.And all that the 'GEM' libs do are 2 pushes and a trap.

|
|||You could write Windows programs without a library as well. So what?
|| Not really.
|
|Yes, really. What could a Windows library possibly contain that you
|couldn't duplicate yourself?
|
No API, no GUI. It's not windows anymore. Just a very intense DOS
program. Nevermind the documentation you'd need to get it to actually
run with the rest of the system.

|| Every ST/GEM1 API call is burned into ST mboards.
|| The same is not true of wintel clones.
|
|So what?

No need to fork out 100bux for WinDoze 95.
The interface is standard and well defined.
An expert user could implement the interfacing with macros
if needed, and type in the headers if he doesnt have those
either.

: locker wasn't working on that particular day.

: Any help appreciated.

The reason that your SC1224 flickwers in mono mode is that the monitor
was never intended to do more than 200 lines vertical resolution, so if
you use Sebra or whatever mono emulator with makes the system think that
you are using a mono monitor, the computer thinks that the 1224 can do
400 lines of resolution.

Er, no. He correctly stated that you need libraries to use GEM (although most
compilers do come with such libraries). Nowhere did he suggest that the
libraries had to do everything.

> we'll be discussing PC's that dont have any BIOS call support. '-p

A PC compiler without BIOS call support libraries is quite possible. Of
course, you could do it yourself with inline assembly. In fact many PC
compilers do have very limited DOS call support, and you have to do most
calls yourself.

Kevin, until now I thought you did know more or less what you were talking
about and were just quibbling about terminology. You have just proved that
you do not know what the hell you are talking about.

OK then Kevin, here's a challenge for you, write a binding for appl_init()
using just a few pushes and a trap. Can't do it? Well, form_alert is one
of the simplest calls, try that one.

Maybe (although you're obviously not such a person...) but the price of
the operating system isn't what we were talking about. Anyone that has

an operating system on their computer - any OS, any computer - can call it properly with or without libraries. It's always much easier with though.

This sounds like "message lag" for want of something better to call
it. It could be a virus but somehow I don't think so.

I used to get this happening with a quick and dirty print spooler I
wrote for MagiC. All it did, was open a window in which it displayed
how many bytes were printed. It worked fine until the print buffer
filled then I would get the same symptoms as you describe.

The "bug" was that I was not using Bcostat() to check the buffer
before issuing the next Bconout(). I guess what was happening was the
Bconout() was going into supervisor mode then waiting until it could
send the character and supervisor mode defeats multitasking so MagiC
could do nothing about the messages until the printer requested more
data.

My theory is that something similar is happening for you. Process A is
waiting on a condition - meanwhile more messages arrive but the
desktop can do nothing about them until Process A finishes doing
whatever it is.

I would start by going through your autos and accs one by one and disabling them, I reckon there's a subtle conflict somewhere.

If someone is looking for Epson Stylus drivers for PageStream, leave me email. I have PS working perfectly with my Stylus (720 dpi), and would be happy to send the driver along.

However, I was wondering if anyone has had success with using 8.5" x 14" on a HP DeskJet 500C using PageStream. My boss is unable to print out onto a full 8.5 x 14 page. All it does is prints right up to the edge of what would be an 8.5 x 11 page, then PS stops and he has to manually send the thing through. The manual says that he can do both sizes and it would be helpful if he could do so.

I've got the Epson Stylus Color driver for PageStream and will post it in
an appropriate place on atari.archive soon. Probably under

atari/Applications/Dtp/Pagestream (if such is available.)

You can run both MFM and RLL drives in Megafile 30 and 60 without any problems
at all. Just put it in and format with either AHDI or ICD Pro.
Its only Megafile 44 that uses a SCSI drive. If you are unsure how to do, plz
E-mail me.

Regarding GIFs as being a cause of bombs in WWW116 as suggested by
Andrew Rose.... (I really need an easy way to quote another's messege)
GIFs are not my problem as I do disable the graphics. I have to do
this as I, um, use a *blush* 2400 baud modem :-). Even without
pictures things are a might bit slow.
I think that I am having a problem with STiK because the IRC program
sometimes works but other times locks up on me.
Everything connects fine, though, and I get a IP address.
NOS has also never given me problems (well, I can't get Pop mail
working in Oasis but that is a different matter).
Does anyone get the feeling that the Internet frustrates me? :-)
Thanks to all for the help!!!!!!!!
-scott tirrell
Speaking of Oasis, their CD gets my thumbs up :-)

1794. Stalker DL problem

Newsgroup: comp.sys.atari.st

From: ad910@lafn.org
Message-ID: <1996Jan27.080056.25694@lafn.org>
Source record: 152048

I'm running Stalker to hook up to my provider.

I get the message that my computer talks to my modem, Supra V 3.2bis, at 19200, and I can read from the led's that my modem is talking to their modem at 14,400, but when I DL, I only get about 48%-49% transfer efficiency.

I'm DL'ing using ymodem because my provider has a bug with Zmodem.

Does anyone have any ideas WHY my transfer rate (character per second) is so slow? Any ideas HOW I can improve it?

Thanks,

Bob

For a German to English translator I use Ruftrade. The dictionaries aren't editable but the translation is easier to work with, having been tested with computer manuals in mind.

the latest version I'm aware of is v2.5

>
>People just have limited time and money resources; few people want to
>maintain and learn two different systems.

This is probably the most true statment in this thread. I use two computers, an Atari MegaSTE and a PC (486SX,25Mhz). I pick which to use for what. For web browsing I use Netscape, cause it has 256colours which I my ST doesn't, it also is almost the 'standard' now. For most other serious stuff though I use my ST. Simply because compared to a PC running windows the ST is tonnes faster. The swap file, and huge programs (such as MS word) slow things down sooo much the ST is much faster.

However the PC comes back into use for most newer games, especially those needing the power, like DOOM, and F1GP which can hack 25fps on a PC, but much much less on ST. Also Raytracing is quicker on PC so I use it for that.

Its really down to personal choice and what you feel is better run on which platform. I'm not going to give up on my ST, just because PCs are there. My ST is better for many things, and a lot more fun and easy to use. However the raw power of a PC CPU, can be very useful at times !

The above is my case. Using a Falcon I know its possible to use the DSP for brute force and produce games like Doom (see BAD MOOD), and to get high res with many colours. However I haven't got any more cash to spend on computers (hence the PC is 486sx, 25 and not Pentium Pro 150/166), and so can't (although i would get a falcon next !).

Keep this in mind, no computer can be BEST at everything, and even old
ST tech has its good points.

Really? I got a Base 64 e-mail, asked about it here, was told it was MIME
encoded, and used ESSCODE to decode it - no problems at all! Are you
trying to decode the who e-mail or just the encoded bit? (Don't know if
this makes any difference, but in my only ever attempt to DeMIME I
stripped the text of everything else and it _did_ work!!)

Ensoniq are a US manufacturer of rackmount & keyboard synthisers &
samplers; & are very popular as they were the first to introduce 'low
cost' sampling for impoverished musicians.

Most modern samplers have SCSI interfaces, but the early AKAI samplers
were available with a host adapter that allowed them to connect to Atari
Megafile drives.

You needed an Atari to format the drive, but AFAIK, the file format was not TOS.

Have you tried setting this to a larger value? They should just
have to agree.

>cfg-file). DNS doesn't seem to work (yet), but using IP addresses does.

Can Slirp handle UDL connections? That might be the problem.
I'm still half asleep but if I remember correctly resolve uses as udl
connection. One thing you can try to avoid this is to edit the
domain.txt in the STIK directory. STIK tries to look for the IP here
before it does an external resolve. You could probably put about any
name you wanted in there with the appropriate IP address and have it work.

>The telnet program crashes, and CAB... well that's the big problem. It

Has anyone had any problem connecting with Hensa? When I ftp://micros.hensa.ac.uk/micros/atari I always get a message such as 550/micros or whatever directory I try..then a prompt -No such file or directory. Is anyone else having this problem? I have tried at different times on different days for a couple of weeks now. Whats the deal???

Josh,

may be I just didn't see your first message but waht does "also" mean ?

At least, I have an atari Portfolio for sale. Would you be interested, I
would send you then further details.

>
>Brian
>

You don't have to do anything special for files. When you configured
OASIS, you set up a mailbox for yourself by specifying your name.
Just use that name in your pop mailbox line. My parameters are:
pop mailbox ccook
pop mailhost [IP Address of mailserver] 3
pop userdata ccook ???poppassword???
Your pop password is likely different than your login password, be sure
to use the right one.

>What kind of file does Oasis look for? What and where do I need to
>have pop name the mail it grabs?

I can advise on two fronts:
a)there is a need to edit the STARTUP.NOS file. I have inserted below the extra lines that I have put into my own STARTUP.NOS file.This should give you some idea how to get going. If you dont modify this file OASIS/NOS wont know what to look for. When you login and want to access mail type the command 'pop kick' (without the apostrophes). This instructs NOS to grab the mail from your postbox on your ISP's system.When mail arrives on your system it will display a screen message advising you of this. Depending on how much mail there is this can take quite a few seconds but you should hear some hard drive activity. Unfortunately there is no message to advise if there is no mail waiting

b)At the NET> prompt type 'help' or ? and you will see a list of commands. One of these is 'pop'. For a list of the pop sub commands type 'pop ?' and this will print to screen a list which will assist you in getting up and running

Sorry about my previous response. The STARTUP.NOS lines were omitted. Here they
are.!!

Setup Post Office Protocol parameters
pop userdata <your name> <your password>
pop timer 600
pop quiet no
pop mailbox tparrett
pop mailhost [your IP address] 3

I assume you can't get at the control panel. Some shells have a setcol
command that could be used. You will need to be a little more specific
on the circumstances in which this utility would be used.

>I would start by going through your autos and accs one by one and
>disabling them, I reckon there's a subtle conflict somewhere.

I've done this, but somehow there's still a problem (though not as
often as before).
I suspected it to be the auto-window topper "Mauswindow", and it
disappeared after I removed it, but then again it's hard to predict
when these strange things happen.
I did however use it for several weeks and nothing happened.

I've replaced it with "autoraise" instead, and the problems only
happen now and then now, but they still happen.

Some time ago I wrote a posting asking people if they had had problems
with the same programs as I have installed. Nobody seemed to have any
problems with any of them, and "mauswindow" should be cleanly
programmed. maybe it's a combination of several programs.

Anyway, this is what I have installed on my STe system (with TOS 2.06
and 2MB RAM).

I'm afraid that you've jumed the gun a bit there, you will need to get your St database running and use the export function to make it into an ASCII file, set up your delimiters and make sure that your PC program will import with the same delimiters and THEN transfer the exported file to the PC and then use the import function. Try to use a delimiter that is not used in your databse, a semicolon is normally a good choice.

>
>Brian
>

Hi Brian,

I've been sucessfully using NOS_POP and OASIS with a SLIP connection
for some time and found that I had to add a setting in my STARTUP.NOS
file and configure the INTERNET/SETUP/USER settings.
i.e. In STARTUP.NOS I configured my POP3 mailbox as follows:

```
# Setup the POP server
pop mailbox myusername
pop mailhost my.mail.host 3
pop userdata myusername password
pop timer 1800
pop quiet off
```

In INTERNET/SETUP/USER PROFILE:

```
mail box name: myusername
filename: myusername
```

I also have a function key chained to the command "pop kick" which polls
my POP mailbox and collects my mail from the mailserv.

I hope that this is of some assistance to you and if you have any other
questions, feel free...

Rob

ps OASIS creates various mailbox files in SPOOL/MAIL (4 I believe) of the form
myusername.* These files are processed by OASIS and the mail process is
relatively seamless._

1823. [FS] HD/CD expansion case for TT

Newsgroup: comp.sys.atari.st
Date: 1996-01-28 00:00:00 UTC
From: damms002@acpub.duke.edu
Message-ID: <damms002-2801962213140001@async166.async.duke.edu>
Source record: 151877

I have a unique expansion case for an Atari TT for sale.

It is a modified top forf the hard drive bay of the normal TT case.

It replaces the conventional top, and provides an additional 5 1/4" full heighth bay right above the built in hard drive. The old harddrive is actually mounted in the lower part of the case, the expansion (either a hard drive, removable HD or, the way I used it, CD Rom drive) goes into the top. Power comes from the internal powersupply and the SCSI port of the additional drive is connected in a chain to the internal SCSI port.

A new SCSI cable with connectors for the internal SCSI bus, the builtin HD and the new drive as well as a cable to add the new drive to the internal powersupply come all with the case, so that it is basically ready to use.

Asking price is 35 $ + shipping obo.

From: rarozijn@xs4all.nl
Message-ID: <4eh0oq$mnq@news.xs4all.nl>
Source record: 151878

Hi everyone,

I have got a problem with my Okami offline-newsreader that I can't seem to solve, whatever I try. The program works perfectly as far as I know (including
gathering and importing news and mail through scripts using the "soup"option) except for one thing: I can't export my replies.
Everytime I try this, in the right place comes a file with no name, consisting
of 13 bytes. If I rename the file, I'm able to look at the file, which always consists the following line:

NEWS news Bn

I've tried every option I could think of.
My system is a Mega STE4, with a
Quantum 425 Mb harddisk, TOS version 2.06. All the internet things are on a 97.9 Mb partition.
I've tried putting the whole setup on a 8.2 Mb partition,
this makes no difference.
I've tried to throw the whole program away, FTPing it again, same result.
Does this problem ring a bell to anyone? I would really appreciate any suggestions you might have.

Thanks a lot !!

Sander.

p> few years back. Agreed its slightly cheaper but then you aren't
p> paying for boxes, nice printed manuals (in most cases), advertising,
p> and most of commercial users overheads.

We have forgotten what "shareware" was really about. Not so long ago the shareware fee (around £5) was supposed to cover the costs of the "enthusiastic amateur" developer and to give him some incentive to support the product (at least) and, maybe, to continue its development especially when the product was such that it was prone to being overtaken by technology.

Nowadays shareware fees are more like £25-£50. There has to be a significant profit element in this. Unfortunately today's entrepreneurs have a fine understanding of the profit motive but often fail to grasp that this carries with it an increased responsibility to their customers. A commercial concern will use their profits to invest in their business and guarantee future support and development (for the most part!) but many shareware authors will abandon their product when they get a new girlfriend, get a full time job, get married, buy a different computer etc. etc.

The upshot is that shareware is a MUCH riskier buy than commercial-ware and has to be approached with even more caution. I have discsful (?) of shareware which is quite useless to me either because it has been abandoned by the author when it is at beta-test status and is as flakey as hell or because it has been overtaken by tecnology (higher TOS, MagiC, MINT, higher serial speeds etc.) and the developer has lost interest.

p> i)Can the person selling, sell the registered version of the
p> software

As with all s/w you have "bought" "permission to use" rather than the s/w itself. There is no problem with selling-on this licence provided the "granter" of the licence will recognise the change of ownership.

I have bought a number of commercial products second-hand and have had no trouble transferring the licence to my name. I can't be sure but I guess that shareware authors would not be keen to do that (if you can find them!)

The risk of discontinued support means that the price of a second-hand shareware licence will depreciate far more quickly than that of a commercial product.

ii)Does the person buying have to re-register the software
p> iii)What about the persons name address etc. that are entered at
p> registering, how are these changed for the new user.

see above.

p> Let me know what you think, its probably more a moral issue than
p> legal, but it would be interesting to see what people think before
p> they come up against the problems.

The transfer of a licence is commercial/legal.

If there IS a moral question it concerns the responsibility shareware authors feel to their customers, having taken their money.

The customer's solution, as ever, is a large dose of Caveat emptor. What are you REALLY getting for your money?

Roger

This is a well-known but very rare AES bug, no virus.
There is an Atari bugfix program for this - look for OVFIX1.PRG.

bye, Peter

Hello Jyri!

Do you mention COLOREMU.PRG by Bernhard Baier from 10.03.89
(written within the code), size: 2524 bytes? Short (german) documentation
is contained in the code of LOMIHI.ACC, both progs work together.
Recently I tried a little to patch it (needs ROM-TOS v1986) - no success.

Does anybody know a low resolution emulator for newer TOS versions?

1835. New Product: Encyclopedia CDROM for ATARI

Newsgroup: comp.sys.atari.st
Date: 1996-01-28 00:00:00 UTC
From: aa414@FreeNet.Carleton.CA
Message-ID: <DLvD7E.Bu6@freenet.carleton.ca>
Source record: 151908

January 21, 1996

HOMA SYSTEMS HOUSE
For immediate release: ATARI CD MASTER: INFOPEDIA V2.0 ENCYCLOPEDIA DRIVER

Homa Systems House is proud to announce the addition of an encyclopedia driver to its range of Multimedia CDROM drivers, the ATARI CD MASTER.

INFOPEDIA V2.0 was released for the PC Platform in December of 1995; it is barely one month old.
INFOPEDIA V2.0 has been rated by popular PC magazines as one the best encyclopedia & multimedia reference tools. It contains the complete 29 volume FUNK & WAGNALLS NEW encyclopedia, with almost 27000 entries and 8000 photo and sound clips. It also contains Hammonds World Atlas and the 1995 World Almanac & Book of Facts, and more!

ATARI CD MASTER: INFOPEDIA v2.0, supports all of the above mentioned features, with its unique, easy to use and modern interface.
- You have access to all of the encyclopedia entries almost instantaneously (it is actually several times faster than the PC version in accessing the entries)
- All the photos and sound clips are "LINKED" the their appropriate article
- Articles are linked to over 10000 TIMELINE entries
- Powerful Search feature allows searching the entries for any keyword, with "narrowing down" option
- Photos are viewable on any ATARI computer at 2, 16 & 256 colors
- Sound clips can be played on ATARI STE or better
- Save and Print
- Fully multitasking

Interface:
- One main window
- 6 TEXT windows with BOLD and Italicized text effects, where necessary
- One picture window
- One tools window which allows picture selection, sound selection, reference selection, and ...
- Modern 3D interface on computers with at least 16 colors
- Flying dialog boxes

System Requirements:
Any ATARI Computer with 4 Megabytes of RAM, Hard disk (3 MB free) and a monitor capable of at least 640x400 in monochrome.

Recommended system : TT030/FALCON 030 with 8/16 Megs of RAM and
resolution of 800x600 in 256 colors (and a hard disk of course).

Prices:
US$ CAN$
ATARI CD MASTER, INFOPEDIA V2.0 34.95 48.95
INFOPEDIA V2.0 CD-ROM 59.95 79.95
Driver and Encyclopedia combo 84.95 118.95

* shipping is included in the price. Taxes are extra, where applicable.
* Method of payment: VISA/MC (3.5% surcharge), cash, money order,
certified cheque.

We strongly recommend everyone to buy the DRIVER and CD-ROM combo
(from your nearest ATARI dealer, or directly from Homa Systems House)
That way we can assure exact CD-ROM match for the driver, since
the CD-ROM is very new.

> is TOTALLY restructured.. A new leader would be appropriate.

This is true and it would seem that unless they really do concentrate on getting a good product to the end user, Atari Corp will fall flat on its face within the next 18 month. The release of the Jaguar at US$99 in the States is an encouraging sign but this move really should have been made 6 months after the original Jaguar launch. The whole point with consoles is to pull in money from the software. I believe Atari receive payments from cartridge sales as well since they are respondsible for the production of cartridges, as Sega and Nintendo do also. Basically Atari needed to get established by selling the units at cost price to get significant market penetration and then bring in the profits from software sales, because once somebody has made the intitial outlay for the machine they are going to want software. It is far harder to get someone to by a new console than to get them to buy games for one they already own! But unfortunately Atari didn't read the play and now Sega, Nintendo and Sony all have competitive units, albeit more expensive, but they all have as much software and much of it is better because Atari didn't motivate developers to get ***good*** games out fast.

> It is a great machine, with great potential. It still has great advantages

> resources etc. It's a shame that marketing does the job in computer-world.
> We need only look at microsoft (yes, small letters are on purpose), who
> manage to support very weak and flunky software using their superior
> marketing power.

Yes, I agree totally. With the right software on your machine it is a far nicer machine to use. I still prefer TOS 2 on my ST and TOS 4 on my Falcon to Windows or the Mac System both of which I use almost every day.

> It s*cks. WE NEED CHANGE

> So let's all snail/mail/fax/phone/travel to ATARI, folks
> I sure will,
> I want to live, not exist,

As TOS computer owners we really don't need Atari anymore, certainly judging by the support they have given us, the users, over the past 10 years they really didn't give a stuff about the customer once s/he walk out the front door of the retailer.

And since they have pulled out of the personal computer market their fate is really no concern of ours. We must now look to, and support, the

manufacturers of the TOS compatible machines such as those in the form of the C-LAB machines, Medusa, PAK board expansion, and the Canadian TT clone (from Computer Direct I think, but the lower end machines from these guys are **way** overpriced and they really should think of restructuring prices because there isn't much bang for your buck in those babies. Their high end ones are nice though and seem fairly reasonably priced).

If Atari are capable enough in the marketplace to resurrect their company into a major player then maybe it might be worth seeing if they will venture back into the personal computer market. But if they screw up from here they have nobody but themselves to blame.

I found an archive on ftp.tu-berlin.de (I think?). It contain the complete
instructions on constructing an interface for the ST, possibly TT,
enabling PC ethernet cards to be plugged into the Atari. If I recall
correctly there were three or four archives and in these were circuit
board designs, etc. Maybe this will help you.

An even better bet, if your prepared to get a CD-ROM, is to get the
recently released Atari Compendium CD ROM. It's go the whole book on there
and is formatted using the HTML language so the WWW browser CAB can load
it in (and CAB doesn't seem to crash when it is not being used on-line so
it is the perfect solution), and you can then jump around the book like
your using the WWW. Available from TOAD, in the US for about US$30. Ask
Dave Troy for more info, dave@toad.net.

Hope that helps,
Anthony

Message-ID: <310B179B.4B1F@prodigy.com>
Source record: 151912

I have never heard of Atari Computers other than the 8 bits they made in the 80's. Just recently I heard of the ST and Falcon. What are they? Are they like Amigas? Macs? PC's? Are they still made? Where can I get one?

I heard a number of people referring to the 'Tramiels' running Atari. Are these the same Tramiels from Commodore?

One last question: Why doesn't Atari market anything they make?

Thanks,
Josh Spatz

Trying to remember back ages ...

It's a simple matter of putting the different telephones one after the
other in DIAL.SCR.

If the connect to a number fails, it dials the next then starts back
at the top.

I think "retries" applies to all the numbers, so if you put "2" in
then it would go through the whole list twice - it doesn't dial the
first number twice etc.

1848. Falcon 030 modem port?

Newsgroup: comp.sys.atari.st
Date: 1996-01-28 00:00:00 UTC
From: musicman@pixi.com
Message-ID: <4efcbe$i0n@rigel.pixi.com>
Source record: 151921

Hello Falcon users....

Tell me about the Modem port on the Falcon 030.....

Why is such a tiny thing...and most modem cable adapaters are much
larger than that? Do I need a special sort of adapter to make my
14.4 modem fit in that tiny hole?

Appreciate any help....

Aloha from Hawaii!

>I have never heard of Atari Computers other than the 8 bits they made in
>the 80's. Just recently I heard of the ST and Falcon. What are they? Are they
>like Amigas? Macs? PC's? Are they still made? Where can I get one?

The ST was a 16-bit machine based on the 68000 (same as Amiga and Mac),
and saw several evolutions adding capability in sound, graphics, and
processor speed, culminating with the 68030-based TT and Falcon series.
Atari decided bigger money could be made in video game sales, and thus
ceased production, selling/licensing the design and development/production
rights to C-LAB of Germany. A number of other US, Canadian, and European
companies manufacture TOS-based computers compatible with the ST.
>>

> I heard a number of people referring to the 'Tramiels' running Atari. Are
>these the same Tramiels from Commodore?

Yes, Jack Tramiel was forced out of Commodore in 1984, subsequently bought
Atari's wreckage from Warner, and had his group of engineers produce the ST.
The rest, as they say, is history.
>>

> One last question: Why doesn't Atari market anything they make?

Executive brain damage. :')

This has happened to me a few times. It's usually a corupt Oasis.opt file, I
just overwrite it with a backup. You have got a back up haven't you?

Have you got Diamond Edge? If so run it over your Oasis partition, Edge will
probably report a file collision with Oasis.opt

1851. Shareware

Newsgroup: comp.sys.atari.st
Date: 1996-01-28 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <822910534_OASIS_@phil4.demon.co.uk>
Source record: 151924

I was thinking the other night about shareware. In this very shareware dominated world, about its sale. What set me thinking was the price of shareware at the moment.In my opinion, it won't be long until shareware is about the same price that commercialware was a few years back. Agreed its slightly cheaper but then you aren't paying for boxes, nice printed manuals (in most cases), advertising, and most of commercial users overheads.

What set me thinking was in a few years time, when almost everything sold is shareware, and people start to sell up their ST's and software collections, what happens about shareware.

i)Can the person selling, sell the registered version of the software
ii)Does the person buying have to re-register the software
iii)What about the persons name address etc. that are entered at registering, how are these changed for the new user.

Let me know what you think, its probably more a moral issue than legal, but it would be interesting to see what people think before they come up against the problems.

1852. MPEG & AVI Playback on 520ST?

Newsgroup: comp.sys.atari.st
Date: 1996-01-28 00:00:00 UTC
From: gripman@netcom.com
Message-ID: <gripmanDLvCL1.I0r@netcom.com>
Source record: 151925

Hi Folks,

I have been cruising the net for well over a year now with my 4meg 520 st and just recently learned how to down load and view some of the pictures from the alt.binary NG's. Is there any way to play back the different animation files that I have run across? I think that's MPEG and AVI files. Also which programs do you folks use to view the jpeg and gif files? I am using the Speed of Light program but it only allows you to load one jpeg image per program run. I am hooked to the Net via a dial up Unix shell account and I browse the Web with Lynx. Many of the files I come across are Base 64 encoded and I haven't figured out how to view them yet. Any suggestions? Also the same question about Mime encoded files. Will the Stick program I've been hearing about work on a dial up Unix shell account? I realize that these are a lot of different questions but I would appreciate any help with any of them. Thanks in advance.

Sincerely,

Jim Cochran

> ST compilier is too small to have GEM library support.

He said he didn't know of a complete compiler system including a resource
editor and GEM libraries that would fit in 1.5 Meg. I don't know whether he's
right or not, although I suspect so. The GEM libraries are pretty irrelevant,
being small, but other libraries, the resource editor, the editor and the
compiler I would expect to exceed 1.5Mb anyway.

>|A PC compiler without BIOS call support libraries is quite possible. Of
> Name one.

Most of them actually. They provide a _bios() function that you can use for
any bios call if you know the opcodes etc, but only a few bios routines have
separate named functions.

Yes, appl_init() is void with no parameters. But what you've written there is
completely wrong. What the hell is the move.w #10,-(sp) for?

>>
>> WHAT'S THE DEAL? The Falcon doesn't really interlace! It just fakes it!
That really depends on your definition of _fakes_ it doesn't do it
like the amiga, it does it as the bloke below suggests, like a TV, and
you don't hear people winge about TVs !!! By getting twice the
resolution on the screen it is interlacing, the way it does it, as
long as it doesn't affect the results is really of no consiquence.

>
>What?!!
>I would say it's interlaced in the true sence of the word!

1.44Mbytes
>
>Is there anyway that I can tell? It accepts my old 800K disks.
Go to the format option on the desktop and it should give a few
options:

Single Sided
Double Sided
High Density

If the last is included then it is 1.44Mbytes, otherwise its only 720K
(can format to 800K+).

If you are still unsure, try formatting a High Density Disk and
formatting it with the High Density option. Then when done use the
show info option to see how much space you have on it.
>
>Also can a 1.44 drive read other than 800K formatted disks?
Yes it can read disks formatted on an Atari or MS-DOS machine upto
High Density, 1.44Mbytes (and even further if extended tracks and
sectors are used). It can read any disk formatted lower than this, as
long as it is Atari or MS-DOS format.

too right you'll end up with problems coming out of your ears. If I
remember rightly to actually have a legal WWW setup, you nee to
register two progs, at about 30quid for the Socket program (like STiK)
and about 30-60quid for Netscape ! (CAB equivalent). I certainly
would'nt fork out for PC just to use for WWW, esp as you'll have to
get stuff like sound cards, and better than SVGA video cards to match
the falcon.

>wolfen@usa1.com
>
I agree with the marketing, or rather lack of. I've always thought
that it was just because I was in the UK that I never saw any
advertising, maybe I was wrong. As far as Atari are concerned, and to
a degree I think they are right, is that they havn;t got the size and
budget to advertise like the huge companies such as Sony, Nintendo and
Sega in todays games market, and probably not even the budget back in
the days of the ST. Where I feel they went really wrong is in the
support side. When atari kept dropping support and developing newer
machines they lost the trust of those, like us who use them, and of
potential customers. Hardware won't sell itself, and as atari won't
support it, and won't advertise it, then they will never sell it !

Its interesting to read the news report in this newsgroup about atari
planning to liquidise its Jag and Atari Interactive assets, how much
is fact or fiction i can't say, but in light of current comments, and
the situation, it really wouldn't be too surprising !

The MSTE does not have a built in SCSI host adaptor. It may well have one fitted though - as many MSTEs were shipped direct from Atari with a SCSI hard disk in. However MSTEs shipped without the hard disk mechanism - didn't have the SCSI host adaptor either.

> per cartridge). During boot the drive didn't get recognized or even
> queried by the controller. The drive itself is a SCSI 1 device (id
> 2) and the cartridge was formatted under DOS (v 5.0). Seeing as I

If you are using AHDI - then try setting the ID to 0. On my TT - AHDI doesn't like gaps in the SCSI ID sequence.

> have *no* experience with using my new toy, I was wondering what it
> takes to get TOS to recognize a newly added device. Are there any

The hard disk driver (AHDI,ICD,HDDRIVER etc) should pick up all SCSI devices on the bus. However with some of them (certainly ICD) - it if doesn't think the device is a hard drive it will ignore it. This goes for CD-ROMs too - so removable media might be the same. With ICD though - you can run the IDCHECK program which gives you a full listing however.

Note the standard ICD utilities only work with a ICD host adaptor. If a dealer retrofitted a MSTE with a hard disk - it may well have the ICD host adaptor. Otherwise it will have the standatd Atari one (if any). The ICD Pro utilities should would with all host adaptors - as does (AFAIK) HDDRIVER.

> avail. Does the disk need to be specially formatted?

It needs to be formatted under TOS/GEM. a 44Mb DOS disk is not accepatable to most Atari hard disk drivers. Try partitioning it on the PC to a 32Mb and a 12Mb or 2 x 16Mb. An Atari *should* be able to cope with a DOS partition if it is the first on the drive - *and* no bigger than 32Mb.

Other things to check are parity, termination and termination power. Host adpators usually fitted to MSTEs don't cope with parity - and don't supply termination power (TERMPWR) to external devices. The external device chain must be terminated - but at least one must be set to provide termination power.

Having said that - the chances are you can ignore termination entirely and get away with it. If the parity is enabled though - you are on to a loser.

:-)

Roland.

> 20, IIRC. (BTW \pc is Pure C).

Okay - so libraries with Atari C compilers are much smaller. However
MS Windows libraries tend to do much more which accounts for them being
a much bigger. In both case they are relying on layers of the OS which are
already there - except that on a PC these are loaded from disk at boot
time - and not in ROM.

> The binary of the `Write' program, part of MS Windows 3.11, contains
> a contiguous block of 14K, filled with zeros. To name but one
> appaling thing from the PC world. But on modern harddisks, this
> amounts to about $0.004, so who cares, right?

Yes - true the 14K block probably shouldn't be there - but also true - it
hardly matters on a PC. Actually it doesn't matter much on a decent Atari
setup either IMHO.

:-)

> the CONTROLLER port (which are DB9 male) with the four serial ports

However as the TT's and MSTE's controller ports are at each end of the seperate keyboard and all the serials are on the back of the system unit - this is not normally a problem.

Fair enough. However the C compiler (GCC in my case) still doesn't *know*
this. It still needs a library function to do the translation.

> |The same can be said of most operating systems.
>
> like so?...
>
> [build call frame] /* already needed for your ANY C */
> push FUNCTION_NUMBER

>
> This is existent but relatively trivial compared to something
> like flibs (which Sozobon left out in it's first release...).

Okay - so its a trivial case on the Atari. Still needs libraries though.

> I'm no Small but, I do have a basic grasp of how the thing
> is put together...

Hmm. Accepted - unless you are still arguing that Atari C compilers have
no need of libraries to access GEM functions.

:-)

> I and everyone else in the world except you call a library isn't.

Seconded. Who cares if the actual function is in ROM or not (and under MTOS
and AFAIK MagiC its not) - they compiler still needs a library to access
it. The library may be trivial - but its still a library.

Roland.

All good reasons to buy NVDI. A decent screen accelerator is not something
you use from time to time. You install it and forget about it! :-) It just
sits there working away speeding things up. If you have to keep turning
it off because its incompatible then its not doing its job.

:-)

1869. Stik and Slirp. Getting there..

Newsgroup: comp.sys.atari.st
Date: 1996-01-28 00:00:00 UTC
From: budtz@dfi.aau.dk
Message-ID: <4efsm7$clo@gjallar.daimi.aau.dk>
Source record: 151942

Hi,

Well, there has been some postings here concerning the compatability of Stik and Slirp... or the the non existence of it (to be more exact). But after some fidling around, getting the newst version of Slirp (1.0c) I succeeded in getting the IRC program working. (The trick is to tell Slirp that both 'mtu' and 'mru' and 'mtu' must equal 252 (as in the Stik cfg-file). DNS doesn't seem to work (yet), but using IP addresses does. The telnet program crashes, and CAB... well that's the big problem. It kinda' works, but I still havn't succeeded in getting a full document. When it works at its best, it DL's most (a guess) of the HTML file, and then repeatedly Connects and DL's a small file (typically 300 bytes). And keeps on doing it.

SO. Any suggestions anybody?

Casper.

I want to thank all of the Atarians that came to my rescue, both
in email and on this newsgroup. This is one of the important
reasons for my sticking with Atari instead of jumping platform.
I feel a bit of pain each time I see someone else leaving - its
the sum of our knowledge and our willingness to help each other
that makes this conference more like a tight knit community.

The answer above is the right one for the Atari board that
supports 4/16M - received it from several sources - and not
a wrong answer in the bunch of them. I also found out there
is an Atari daughter board that will only support 4M. Have its
number in another message.

So in less than 24 hours of posting, my TT is happily purring
away with 4+16. Thank you all. Wayne Booth

It turned out that the version I made available didn't work on machines
without FPUs due to some square root calculation.

Fortunately, the program seems works fine with the offending instructions
simply removed, so there's now a new version available.

Have fun!

asr10
>sampler scsi?

What's the name of the drive? Any labelling or anything? A harddisk
isn't just a harddisk- there are different standards.
If the harddisk was connected to your ST via a "host-adapter" like the
Link or Link II it's an SCSI, but if it's one of the original Atari
drives it's not.

If it is an SCSI type I see no reason why the drive couldn't be used
with your keyboard. But 52 MB isn't really much now, is it?

Slow as apparently 100k/s to 200k/s - and AFAIK (the DE600 one at least)
- no internal modifications are required - though you do need to build an
adaptor board for the cartridge port.

Does anyone realize that this argument is completely unrelated to the original subject/question unless you are a developer trying to squeeze a little more memory/hard drive space out of a machine? Arguing on the technicalities is rather worthless, trivial, and an obvious flexing of egos (I know more than you, no you don't, idiot).

Here's why I BOUGHT and use a Falcon030 (Atari-badged) rather than a PC:
-
1) I am a college student at the US's #1 business specialty school. The standard is PC, and from what I can see, the PC campus network used is so unreliable that it is incredible. Gateway 2000 and certain other brands of clones don't run the boards properly (some have even fried), and if you want help setting up all the hellish related Windoze and Banyan files, you have to turn to a consulting firm - they give you two hours of free saupport, and then charge $110 an hour afterwards - JUST to connect to a network to use E-mail and Netscape!!! I hate WIN.INI modifications and other such stuff (even though I do them for PC-using friends all the time), and I'll be damned before I double my computer expenses to connect to this waste of money (this situation, by the way, is common in many Boston colleges).
_
2) I have a graphics design business (magazines, brochures, and recently Web pages) that helps pay the bills. Say what you will, but the PC simply does not have tools comparable in power and ease of use as Studio Photo, Calamus SL (yes, yes, YES), Invision 2.0, and LineArt for the prices that these tools sell for (both in dollars and resource requirements). In order to perform the same sorts of tasks I'm doing with a 4 meg Falcon with 800 megs of drive space, I'd have to shell out $2000 + for a sixteen meg Pentium system, an additional $2,000 for associated software and scanning hardware - over twice what I've spent. And it would still lack the consistency, elegance, and downright friendliness of the Falcon - the machine that so allows me to put my ideas on paper that I consistently beat out professional design houses for design jobs.

-
3) One of the biggest rigors of attending a competitive school is the out-and-out need for word processing and spreadsheet capabilitty. Here, too, the Falcon shines. Papyrus Gold provides more than ample word processing power for even the most demanding WP needs - and doesn't consume a lot of space. KSpread Pro is an excellent spreadsheet, one that I use for all of my financial seminar assignments. I have yet to see Excel users best it in output quality (or usability). Perhaps the best example of this is all the PC/Windoze3.1/Win95 people who "borrow" my Falcon to type up their papers and do their work, because my system is "so much faster" and "doesn't break all the time." Sorry, folks, cursing a novice with Win3.1 and Win95 doesn't help them at all. If anything goes wrong with all those frequently accessed files, the machine crashes, and the user is left hanging. Toll and 900-number calls for help to a manufacturer rarely improve the situation in terms of cost.

What's it really all come down to? Cost and customability. The Falcon can do just about anything you need it to do (except networking via standard means), and you can start a lot more cheaply than you can in the PC world. Life with TOS is simple, but can grow with you if you need it to, simply by adding easy-to-use accessories. Applications are plentiful, excellent, well-developed, and well-supported (where this "no software" argument came from, I have no clue - we are better supported in professional/productive areas than the "better selling" Amiga). You don't need to be a programmer to figure out how to change WIN.INI files, CONFIG.SYS, AUTOEXEC.BAT, since there are none. You don't need to modify your system, allowing several different, incompatible options at bootup, since everything works together in a logical, well-thought-out manner. And you get the best data-level compatibility of any computer on the planet - able to deal with Mac and PC disks in addition to Atari.
-
So go out and test both systems, really test them. Look at associated applications and the impact on your wallet. Then go out and buy the system that does what you want at the lowest price. That
's what I did, and I'm very happy with the decision.

I have seen files which describe how to attach PC graphic cards to the ST.
These files describe the construction of an ISA adapter, maybe the IDE
drive could also use this interface?

>
> >What are the advantages of IDE vs SCSI?
>
> None at all. On the PC the interfacing is simpler, so it makes for cheaper
> systems. It's generally slower although modern IDE drives approach SCSI ones

On the ST, hard disk I/O is via the ACI port & this is limited to around
1.25 Mbyes/second. If an IDE adapter could be built, might it be faster as
it would probably connect straight onto the bus?

Of course, there would not be any DMA transfers.

m > such a tiny thing...and most modem cable adapaters are much
m > larger than that? Do I need a special sort of adapter to make
m > my 14.4 modem fit in that tiny hole?

what it is - Atari went with industry standard ports when they
released the Falcon. What you see there is an AT-style port which
the clone industry went with for hooking up a DOS box with an
external modem - I believe it's referred to as an RS232C port.

In any case, there should be no problem finding a replacement
cable. That's what i did when I got my Falcon.

>
>1) Can the memory be upgraded and if so how high.

Yes, to 4Mb. If it is STFM then a special addaptor board needs to be used. I upgrade my 1040STFM using the MARPET board which then takes standard 30pin simms. If its a STE then it'll
take the simms direct. The simms need to be 30pin (80/100 ns acess) 256K, 512K or 1MB and need
to be fitted in pairs.

>2) What's the deal with these monitor resolutions.

As you no doubt seen, there are three screen rez.
LOW = 320x200 16 Colours @50/60 Hz
MEDIUM = 640x200 4 Colours @ 50/60 Hz
HIGH = 640x400 1 Colour (ie Monochrome) @ 70Hz

>3) Can you hookup a cdrom, what about a hard drive.

Yes, any SCSI device can be hooked up , though you would need to have an adaptor to convert from ACSI to SCSI.

>4) Is there oop programming languages out for it ala c++, Visual basic.

Not sure, though I'm sure I've seen a smalltalk compiler in PD/Shareware.

>5) Can I ftp atari programs to my pc then copy them to a 720k floppy
>and use it.

Yes, do it all the time. PC at work for access to Internet/Ftp sites and then take the stuff home on 720K disks. You will need to format the disks on the PC though, as the PC cannot
read disks formatted on ST

>6) Is there any user groups/bbs in Georgia or Florida.
>7) Can someone tell me what is rainbow TOS and what the latest release
>was.

Rainbow TOS (1.04 STFM and 1.06 STE) was the last release for ST's. From the desktop, access the FUJI menu and select About ... item. The form shown has the /|\ FUJI symbol in colour (LOW/MED Rez). Some companies have developed the ability to add TOS 2.06 to ST's however

I personnally use third party software to improve the system (NIDI and GENEVA).

The only company which I know of supporting Atari on that side of 'pond' is Toad Computers, there may be others.
Try http://www.toad.net/

Hope this helps

Andy.

: >Are there any users of TimeWorks SwiftCalc v2.0.

Best free/shareware math program for Ataris I have seen is
Euler... Has nothing to do with your guestion, but the
program is well worth a check. :-) It should be on most
Atari ft-sites.

The accessory Butler James does this (among other things, such as a mouse
acceleration, virus protection, etc...). It's shareware, so register it!

No need to sound so snotty young spud.....I meant that you can get the latest MiNTlibs (pl46) for Lattice 5.52 in the same way you get them for GNU C - download the bloody things from a decent FTP site. And I stand by what I said about the MiNT-net libs - you cann't get them from HiSoft at all. The libs that HiSoft provide are not updated often enough to keep the pace, and so are out off date - you are better off using the downloaded librarys as they are always the very latest.......and there is no reason not to use 5.52 to do that.

Craig.

1888. Setting up Mintnet from TAF disks

Newsgroup: comp.sys.atari.st
Date: 1996-01-29 00:00:00 UTC
From: ai066@FreeNet.Carleton.CA
Message-ID: <DLy94M.I6t@freenet.carleton.ca>
Source record: 151661

As I have been having a few problems with STiK/CAB, I thought I'd finally scarifice a partition on my harddisk to Minix/Minnet. I ran the Toronto Atari Federation's setup, and am at the point where I will uncomment certain lines to correctly start Mintnet and a shell.

I do not wnat to load the X extensions, and so I have left those lines commented. If I want to go into a shell, what should I do to the file? Can I just leave the INIT C= tcsh line?

ANy hints/suggestions would be welcome! Also, the source of a good doc file for non-unix wizards...

^^^^

That was the first original price, it dropped soon. The usual price was about 300,- German Marks, ~ US$ 160. The last ones in Europe were sold at the proTOS for DM 99,- (~ US$ 55).

> 3) There is another company in germany (PAM Software GmbH) who
> used to sell ethernet cards and external devices (ACSI), but I dont
> know if they still exist:

AFAIK, PAM doesn't sell hardware without software (or has he changed his mind?), and the software is stupid and very expensive. But the PAM VME-boards are supported by Linux.

> I think that there is actually no Linux-m68k driver for an ACSI
> (DMA) external solution.

The driver doesn't exist yet, but someone (Torsten Lang) is working on analyzing the protocol used. If he has gathered enough infos, there may be a driver for it.

David White (david.white@rd.eng.bbc.co.uk) wrote:
> This is all mouth watering stuff ... but ... what about compatibility? A feature
> of Atari GEM has always been backwards compatibility. It would not be a good

I should point out that (with the exception of non-blocking calls) there is no
reason that programs that use new features won't work on older OS versions.
For example, virtually all modern programs support Iconify - but older OS versions
ignore it with no harm done. The same goes for drag & drop, and several other things
as well. It's not a problem.

> thing to create a brilliant interface if applications written to take advantage
> of it will not run on the other GEMs (NAES, Magic), let alone TOS 1.6! How are

Both MagiC & Geneva provide extensions to the AES, just as NVDI provides extensions
to the VDI. What I'm suggesting is that they shouldn't be developed in isolation.
If there are new features going to appear, then all derivatives should try to produce
the best possible set of extensions, for maximum support & userbase.

> addressed? I can understand that you don't want early GEM to be a millstone
> around your kneck, but creating various incompatible strands of GEM would shoot
> the Atari market in the only foot it has left.

Early GEM isn't really a millstone. I'm not going to waste time persuading very
badly written programs from the dawn of time to work, but I'm not going to limit
what could be done either. There's always the appl_getinfo() call to check what extensions
are available anyway.....

Craig.

1894. FOR SALE: 170 MB SCSI Hard Disk

Path: c4sy
Distribution:
Followup-To:
Organization: De Montfort University, Leicester
Subject: 170 MB bare SCSI mechanism FOR SALE
Keywords:

Hi all,

I have a 170 Mb hard disk for sale. It needs a casing, Power Supply etc and the
correct cable to fit to your machine.
It will fit inside a TT or Mega STE with the SCSI card fitted.

Its only around 6-8 months old, (Quantum exchanged it !)
Its a Quantum 170LPS
Its rated around 1550 k per sec on my Falcon
It has not bad sectors.

The sale is because I need to upgrade !

I'll sell it loaded with ST/Falcon software or with Linux installed (runs on any
'030 with a 68881/2 FPU).

Preferably the buyer should be in England as its easier!

Any offers to my e-mail address or give me a phone call.

1895. Re: -* Apex Media Animator *- Graphics for the Falcon 030 -*

Newsgroup: comp.sys.atari.st
Date: 1996-01-29 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <4ej0n5$l29@huron.eel.ufl.edu>
Source record: 151668

Hi friends:
I noticed that there is a need for information on new comercial and shareware programs. I had an idea this morning that maybe we could help each other by posting a small description of a program we like and place to get it. this will be of help to new St/Falcon owners as well to anyone looking for new specific programs Graphics/Desktop Publishing etc. What is your idea on this?

Here is the firs one:

=-=-=-=-=-=-= =-=-=-=-=-=-= =-=-=-=-=-=-= =-=-=-=

=-=-=-=-=-=-= =-=-=-=-=-=-= =-=-=-=-=-=-= =-=-=-=
Apex Media Animator:

Apex animator layout reminds me very much of CyberPaint. Unlike Cyber Paint apex has the capability to work with 24 bit and 16 bit color graphics. It also has virtual canvas and can work in true color, 256 or B&W.

Like Cyber it is very easy to use and its menus and dialogs are very elegantly ley out in marble and gold. The same Amiga visitor said WOW! when he saw the Cyber dials in action. Cyber dials are spinning dialogs boxes. These will spin and will grow in size from very small to the front of the screen. While this is only for looks, it is a nice feature that will impress even an Amiga user!

The Program:

Apex.prg loads very fast. It's layout is very impressive. The menus, dialogs, and function bottoms, look like grey marvel stone. The main screen frame is composed of three sides. The eight workstation selectors are placed at the top, the tools menu on the left side, and the frame selector display on the bottom.

All workstation modules and their related tools are represented by easy to understand icons which have their keyboard equivalents as well. A short description of the tool or module will appear as the mouse glides or is placed over and icon or button.

The bottom half of the tools menu situated vertically on the lest side,displays seven icons which are visible at all times.

There is an animation slider speed control, and below it there is a memory bar which displays graphically the amount of memory consumed. Clicking on it bring a dialog box with numerical about the program memory status.

A diamond looking icon is used when right clicking to swap out of the program temporarily to the desktop. left clicking or pressing "Q" will exit the program.

The Monitor icon is used to access the VIDEO OPTIONS MENU, and the available resolutions are:

320x200
640x200
320x400
640x400

Page or canvas size are user selectable.

Video Modes:

True Color
256 Colors
Grey Scales
PAL or NTSC

Other Modes:

512 Colors
4096 Colors
262,144 Colors
16.7 Million Colors

After selecting the new video mode and exiting the dialog box, the screen will go dark for an instant and the new mode will take effect.

The Disk icon selects the DISK OPTIONS menu. This menu offers a variety of files to load and save and options.

Formats supported;

PC1,IFF,SPU,PCS,TGA,MTV,JPG,GIF,FLC,SEQ,ANN,APX,CFN,DAC,FWR.

CFN are Calamus fonts.
FWR is used to save the Apex morphing vectors or Warp lines.
APX is used for saving any size image, clip,or brush (they load very fast)

The CFG button, saves information about Apex current configuration as for example the screen resolution, canvas size, number of colors etc.

One of the powerful features of apex animator is its able to load an image or animation sequence over an existing animation any number of times. This means that animations can be overlaid and pasted to compose very complex animations. Lets say that you had a video clip of someone playing the guitar in front of a 'blue screen", using the paste file or paste animation you could (after converting the blue background to transparent) paste the clip over a mountain scene. Now your guitarist is performing on top of your favorite mountain! Animation files can be pasted under or over an image and at the beginning, middle or end of an existing animation.

The AMR icon (like Cyber) selects if the operations are to affect a frame, sequence or full animation.

The brushes and pencil icons works like the ones found in most graphics programs. A clip can be stored in memory and used as a brush. There can be 4 clips or brushes in memory at a time. These can be saved as APX files.

The I icon activates the Preference menu. Here options like cyberdials,upgraded CPU,compression method etc. can be selected.
clicking the left mouse button displays program version and user registration information. Clicking a second time on the dialog box will give you a pleasant surprise! This will show you the quality level, detail and work that has been put into Apex Animator.

The lower Barr, is the FRAME POSITION SLIDER. It displays the number of current frame. Pressing and holding the left mouse button on this barr works like the shuffle function on a VCR.

Buttons to add and clear frames are placed on both sides of the Frame Position Slider.

The Color Palette is located below the F. P. Slider, and it displays a palette of 256 colors. Each frame can have its own palette in 256 color mode.

To the left and below the Color Palette there are four small cycles that flash and give feed back on Apex busy activity. Coordinates are displayed the same level on the right side.

THE WORKSTATIONS:

There are eight workstations.

The Standard Drawing workstation

The Cell Manipulation Workstation:

Here a block or clip of any size can be rotated, scaled,repositioned,in real time. There is also a Perspective tool. Blocks can be cut manually with rubber box and blade (for regular and irregular shapes) and also automatically.

The Color workstation:

This is where palettes are created and colors are mixed using RGB,CMY or HSB.

The Digitizing Interface:

With the addition of the Expose digitizing hardware, 24 bit (16,777,216 colors per image). and 16 bit images (65,536 colors per image) in True Color can be digitized or imported into the Apex World.
There are settings here for Photographic grabs, with several shutter speeds and Cinematic grabs with Interlaced, non Interlaced and wide screen options.

Expos
permits this digital image to retain a 16-bit plane true color palette (or in other words, a picture containing 65,536 colors per image), thereby retaining near photographic quality. In addition, the supporting software, APEX Media (sold separately), further boosts this capability to realize even higher resolutions in 24 bit color (16,777,216 colors per image).

Using Expos
and APEX Media to capture live video in real time allows a sequence of images to be compiled into an animation, which can then be played back within APEX Media or stored as FLC/FLH file.

The Non Linear Drawing Tools:

Realistic airbrush with flow control (ink and mask
Fill
Draw
Analog Mask Options. This is used to define a color or area for processing.

The Film and Image Filters:

these are tools that can be applied over a selected area on any number of frames automatically.

Noise Suppression
Image Dejag
Motion Suppression

The Morphing and Distortion Workstation:

Apex Animator contains a very powerful morphing module. Here an image can be morphed into an other over a sequence of frames to produce a smooth effect. defined warplines can be saved on disk for later use.

The TEXT Interface:

This allows the use of Calamus vector fonts. Character space and size can be defined. (I would like to see in future updates the support for truetype fonts)

The Manual:

Apex comes in a nice box with a well written manual. The manual has overview and in depth sections describing each module and tools. It also describes image and compression formats as well as some tips on creating neat effects using the available tools. The sample disks contains sample images and small FLC animation files created with Apex.
I got news from Titan Design that they are working on a new version of Apex Media that will incorporate some Cyber like features and possibly audio. My advice is:

If you are into graphics get Apex Media Animator.

Available from TOAD COMPUTERS:
Apex Media
Multimedia Graphics Software$149.00 Apex Media Lite
Lite Version of Apex Media$59.95 Expos

Expos

NTSC Video Capture Hardware$399.00 Expos

1897. Re: New Atari owner

Newsgroup: comp.sys.atari.st
Date: 1996-01-29 00:00:00 UTC
From: greeny@spirit.demon.co.uk
Message-ID: <823018468_OASIS_@spirit.demon.co.uk>
Source record: 151670

Sorry about the last post but this is what it meant to say!

I just inherited a old atari 520st and I have many questions
How old?
about it. First I would like to thank anyone answering it would be

much appreciated. O.K., so here it goes.

1) Can the memory be upgraded and if so how high.

Depends. If it's an STe (e for enhanced) it's easy.
Just open up the machine, remove some shielding, and you'll find 4
simms slots. Two will be full of quater meg simms on a half meg
machine. replace these two with one meg chips or fill all slots with
one megs for 2 or 4 meg machine.
An expansion board is needed to do the same with STfm or older.
There is a way to beat the 4meg limit but it starts getting costly.

2) What's the deal with these monitor resolutions.

ST screen memory is the same whatever resolution you use;
colours go down as resolution goes up. Video memory is not seperate
and is part of the standard half meg you already have.
STlow = 320*200*16colours, STmed = 320*400*4colours are both
available on TVs via Co-Ax out (but poor quality) or via monitor out
to RGB monitor (ie philips 8833 i think) or via special Atari to scart
lead to any tv that can accept R.G.B. scart. Composite video scart TVs
can be used but this needs a little soldering internally in your ST.
ST high 640*400*2colours is only available on dedicated hirez
monitors and will be greyed out as an option if one isn't connected.
The high rez monitor pulls down a 5v detect line in the lead letting
the ST know it's there. Ther are PD utilities to emmulate Hi rez on
colour monitors but are not to be considered for extended use. Most
VGA (pc) monitors need only the correct lead made up to access Hi-rez
mono.

3) Can you hookup a cdrom, what about a hard drive.

There is a hard drive port on the back of your machine. Atari wisdom
demanded it not be SCCSi but a subset of the commands and so, now with
the dearth of Atari badged drives a host adaptor is fitted onto the
cable at the drive end.(ie icd link , toplink etc.) After this
addition to the first drive further sccsi devices can be chained as
normal including CD-roms. These however require special drivers
sometimes available as part of the host adaptor package.

4) Is there oop programming languages out for it ala c++, Visual basic.

Yes, but I dont programme so let someone who knows what they're doing advise you here. HiSoft basic seems popular here.Atari basic was reportedly crap.

5) Can I ftp atari programs to my pc then copy them to a 720k floppy and use it.

Yes, try Toad.net or Umich.edu or micros.hensa.ac.uk
No problem!

6) Is there any user groups/bbs in Georgia or Florida.

Not the foggiest!

7) Can someone tell me what is rainbow TOS and what the latest release was.

TOS ran from 1.00 disk loaded (very rare) up to 1.4 which was the first relatively good copy. This was the best untill the STe which had 1.6 (buggy) and was quickly replaced by 1.62. This 1.6* supported the extra pallete and better sound. The Mega STe arrived with TOS 2.05 which was a far better job but was incompatible with more early programming (as were all updates but to a lesser extent) This too was buggy and was itself replaced by 2.06.
In england we have a source of 1.62\2.06 hardware switchable chips which seem to be the best of both worlds.
Tos 3.** and 4.** are for the TT and falcon respectively and need not be considered unless your planning to upgrade the processor to a 68030 (costly but very speedy!)

Again any answers would be a help, I don't have any docs or software for it.
Thanx
Mark Scheck
marksh@freenet.scri.fsu.edu

Mark Thomas Scheck

Hope some of this helped

Source record: 151673

The Falcon has a 1.44Mb floppy drive. I should be capable of reading your old 800K disks but I'm not sure that others will work. :)

It is possible that the Falcon disk drive is a high density drive (there are two holes punched in your disk (one with the little tab on one side and just a hole on the other side). These disks CAN hold up to 1.44Mb of data but your 800K disks will not be able to hold any more.

OK :)

and wpls2rtf-tos.zip.uue
to comp.binaries.atari.st and hope it will appear soon. I found no way of uploading it to the overloaded archive sites.

It is also available on the web:

<URL http://www.cs.vu.nl/~js/warez/js-ware.html>

WPLS2RTF is a file conversion utility to convert First Word Plus (a word processor commonly used on Atari ST computers, and not-so-commonly on other platforms) files into Interchange Format, aka Rich Text Format (RTF).

The full release -- wpls2rtf.zip (106kB, 146kB uuencoded) -- consists of documentation, Macintosh, DOS and TOS applications, CodeWarrior 8 (Mac), Borland C (DOS) and Pure C (TOS) project files, MPW and Unix makefiles, sample translation configuration files, the sourcefile and everything else that's needed to build the thing just about anywhere.

The partial Mac release -- wpls2rtf-mac.sit.hqx (24kB, 33kB uuencoded) -- contains the documentation and the TOS-specific files only.

WPLS2RTF is written and submitted by JS <mailto:js@cs.vu.nl>, <http://www.cs.vu.nl/~js>; credit is due to Leonard Rosenthol <leonardr@netcom.com>, Marshall Clow <mclow@san_marcos.csusm.edu> and Stephan Somogyi <somogyi@ziff.com> without whose nifty DropShell 2.0 framework the Macintosh application wouldn't have been such a minor effort.

Enjoy, J.

Thankyou Roger - my thoughts exactly. But, beings as I was sat playing Yukon under XaAES last night, whilst running Lattice & CALAPT (Grin), I think a techie beta (email only) is in order. Anyone who wants to loan a few brain cells to the effort, mail me and I'll be sending out the first techie beta to folks who want to help before the end of this week.

Craig.

I've got a usable demo of a commercial program (I think it's from Norway - I'll check) called Scooter. It's a fantastic PCB layout program. Multilayer, manual and auto routing, librarys, the works....it's as good as PC based programs, and much better than Platon (moderner as well - it uses colour for a start).

As I say, I cann't remember the contact address , but I'll dig it out as the program is fantastic.

Craig.

1904. Shareware

Newsgroup: comp.sys.atari.st

Phil,

P > In my opinion, it won't be long until shareware is about the same
P > price that commercialware was a few years back. Agreed its slightly
P > cheaper but then you aren't paying for boxes, nice printed manuals
P > (in most cases), advertising, and most of commercial users overheads.

First, I would agree that "some" shareware is overpriced, but not that often.

Second, many shareware authors "do" provide boxes, manuals, and sometimes
they even advertise.

Third, unlike commercial companies, the shareware author doesn't have the
volume that commercial companies do. Commercial companies can afford to sell
things at low prices because they sell enough product to make up what they
lose with the lower price. But, even semi successful Shareware authors may
only get a few registrations a month. Even at the current pricing levels,
most can't survive on that kind of income, and it certainly doesn't pay back
the development time they've invested.

P >i)Can the person selling, sell the registered version of the software

I can only speak for myself (Mountain Software), but I have no problem with
users selling my products to other users as long as they notify me of the
sale (so that I know who to send update notices and new product
announcements).

P >ii)Does the person buying have to re-register the software
P >iii)What about the persons name address etc. that are entered at
P >registering, how are these changed for the new user.

Again, speaking only for myself, I would have no problem with the new user
keeping the old registration information, AS LONG AS I KNEW ABOUT IT. If I
don't know about it, I may think that two users are using the same product,
i.e. someone has violated the copyright.

However, if the program includes the users name/address/etc. (not just a
serial number), and the new user wants the program in his/her name, all I
would ask is $5 to cover the cost of shipping out a new disk. Commercial
companies may do this for free, but small shareware operations usually can't
afford to foot the shipping costs on their own.

1905. Gemulator 4.11

Newsgroup: comp.sys.atari.st
Date: 1996-01-29 00:00:00 UTC
From: awatson@pacifier.com
Message-ID: <4eirja$k8t@pacifier.com>
Source record: 151678

Hello,

I recently purchased Gemulator 4.11 and am having a few problems. I have spoken with Branch Always software but their opinion is that it is me or my machine. In any case, I'm wondering if anyone else has had these problems, and if so have you found a solution:

1. I cannot save the Gemulator Window position? No matter where I put the window, as soon as I click SAVE in the preferences menu the window jumps back to the upper left corner of the screen.

2. When printing, the last byte or two of whatever I'm printing doesn't go to the printer. Usually this is the line feed character which means the page gets stuck in my printers buffer and I have to eject the page manually. If I try to print the page a second time, those missing characters finally get sent to the printer and the first page is ejected. But now the second page gets stuck in the printer buffer because it's still missing that last byte or two...

3. I cannot run the VGAWIN.PRG program from the AUTO folder. If I try, the whole Gemulator window ends up compacted against the left side of the screen and cannot be moved or otherwise accessed.

I would appreciate any feedback other Gemulator users can provide!

Thanks,

Anthony Watson

: Can I just leave the INIT C= tcsh line?

I am not at home right now, so don't have a MINT.CNF file in front of
me; going by memory, please forgive me if I get something wrong...

In any event, you can do two things. You can INIT a shell, or INIT
GEM. I have MultiTOS, and so mine looks like:

INIT=c:\multitos\gem.sys

Or you can equally do:

INIT=c:\bin\tcsh

I prefer the first, booting with GEM, this way I can use CAB from within
MultiTOS.

>
>In the future, programming will be as easy as...

Really? I don't think so. Yes, it will be easy to do some things, but you are limited. Ceratinly judging by what I've seen so far, the easier these things are the less flexible they are and the slower and less reliable the generated code. And besides, who writes the software for you to do your graphical programming in? Someone with a C compiler most likely.

And C isn't enough either, you'll need an assembler to get a system running on a new processor.

So although ordinary users may be able to get by without using C or any languages on that level, some people will have to.

I, also was greatly baffled by GDOS. My inquiries were to no avail.
I then acquired, as part of an ST system, the program Fontz, by Neocept.
(out of business, I believe) Through Fontz, I not only got to design my
own GDOS fonts, but came to understand (somewhat) how GDOS works. (though
not in such a way that I would attempt to explain it here, or to anyone
else, for that matter. But I was able to arrange my assign.sys file and
GDOS.sys, so that GDOS works for me.

Configuration: CASIO CZ5000
ATARI ST1040

When I send a message from the Atari to the Casio via midi, I always get
the same note, even if I change the note number code (midi msg).

Any help welcome,

Luis.

1912. -* APEX MEDIA ANIMATOR *- Graphics for the Falcon 030

Newsgroup: comp.sys.atari.st
Date: 1996-01-29 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <4ej17v$l6m@huron.eel.ufl.edu>
Source record: 151685

Hi friends:
I noticed that there is a need for information on new comercial and shareware programs. I had an idea this morning that maybe we could help each other by posting a small description of a program we like and place to get it. this will be of help to new St/Falcon owners as well to anyone looking for new specific programs Graphics/Desktop Publishing etc. What is your idea on this?

Here is the firs one:

=-=-=-=-=-=-= =-=-=-=-=-=-= =-=-=-=-=-=-= =-=-=-=-

=-=-=-=-=-=-= =-=-=-=-=-=-= =-=-=-=-=-=-= =-=-=-=-
Apex Media Animator:

Apex animator layout reminds me very much of CyberPaint. Unlike Cyber Paint apex has the capability to work with 24 bit and 16 bit color graphics. It also has virtual canvas and can work in true color, 256 or B&W.

Like Cyber it is very easy to use and its menus and dialogs are very elegantly ley out in marble and gold. The same Amiga visitor said WOW! when he saw the Cyber dials in action. Cyber dials are spinning dialogs boxes. These will spin and will grow in size from very small to the front of the screen. While this is only for looks, it is a nice feature that will impress even an Amiga user!

The Program:

Apex.prg loads very fast. It's layout is very impressive. The menus, dialogs, and function bottoms, look like grey marvel stone. The main screen frame is composed of three sides. The eight workstation selectors are placed at the top, the tools menu on the left side, and the frame selector display on the bottom.

All workstation modules and their related tools are represented by easy to understand icons which have their keyboard equivalents as well. A short description of the tool or module will appear as the mouse glides or is placed over and icon or button.

The bottom half of the tools menu situated vertically on the lest side,displays seven icons which are visible at all times.

There is an animation slider speed control, and below it there is a memory bar which displays graphically the amount of memory consumed. Clicking on it bring a dialog box with numerical about the program memory status.

A diamond looking icon is used when right clicking to swap out of the program temporarily to the desktop. left clicking or pressing "Q" will exit the program.

The Monitor icon is used to access the VIDEO OPTIONS MENU, and the available resolutions are:

320x200
640x200
320x400
640x400

Page or canvas size are user selectable.

Video Modes:

True Color
256 Colors
Grey Scales
PAL or NTSC

Other Modes:

512 Colors
4096 Colors
262,144 Colors
16.7 Million Colors

After selecting the new video mode and exiting the dialog box, the screen will go dark for an instant and the new mode will take effect.

The Disk icon selects the DISK OPTIONS menu. This menu offers a variety of files to load and save and options.

Formats supported;

PC1,IFF,SPU,PCS,TGA,MTV,JPG,GIF,FLC,SEQ,ANN,APX,CFN,DAC,FWR.

CFN are Calamus fonts.
FWR is used to save the Apex morphing vectors or Warp lines.
APX is used for saving any size image, clip,or brush (they load very fast)

The CFG button, saves information about Apex current configuration as for example the screen resolution, canvas size, number of colors etc.

One of the powerful features of apex animator is its able to load an image or animation sequence over an existing animation any number of times. This means that animations can be overlaid and pasted to compose very complex animations. Lets say that you had a video clip of someone playing the guitar in front of a 'blue screen", using the paste file or paste animation you could (after converting the blue background to transparent) paste the clip over a mountain scene. Now your guitarist is performing on top of your favorite mountain! Animation files can be pasted under or over an image and at the beginning, middle or end of an existing animation.

The AMR icon (like Cyber) selects if the operations are to affect a frame, sequence or full animation.

The brushes and pencil icons works like the ones found in most graphics programs. A clip can be stored in memory and used as a brush. There can be 4 clips or brushes in memory at a time. These can be saved as APX files.

The I icon activates the Preference menu. Here options like cyberdials,upgraded CPU,compression method etc. can be selected.
clicking the left mouse button displays program version and user registration information. Clicking a second time on the dialog box will give you a pleasant surprise! This will show you the quality level, detail and work that has been put into Apex Animator.

The lower Barr, is the FRAME POSITION SLIDER. It displays the number of current frame. Pressing and holding the left mouse button on this barr works like the shuffle function on a VCR.

Buttons to add and clear frames are placed on both sides of the Frame Position Slider.

The Color Palette is located below the F. P. Slider, and it displays a palette of 256 colors. Each frame can have its own palette in 256 color mode.

To the left and below the Color Palette there are four small cycles that flash and give feed back on Apex busy activity. Coordinates are displayed the same level on the right side.

THE WORKSTATIONS:

There are eight workstations.

The Standard Drawing workstation

The Cell Manipulation Workstation:

Here a block or clip of any size can be rotated, scaled,repositioned,in real time. There is also a Perspective tool. Blocks can be cut manually with rubber box and blade (for regular and irregular shapes) and also automatically.

The Color workstation:

This is where palettes are created and colors are mixed using RGB,CMY or HSB.

The Digitizing Interface:

With the addition of the Expose digitizing hardware, 24 bit (16,777,216 colors per image). and 16 bit images (65,536 colors per image) in True Color can be digitized or imported into the Apex World.
There are settings here for Photographic grabs, with several shutter speeds and Cinematic grabs with Interlaced, non Interlaced and wide screen options.

Expos
permits this digital image to retain a 16-bit plane true color palette (or in other words, a picture containing 65,536 colors per image), thereby retaining near photographic quality. In addition, the supporting software, APEX Media (sold separately), further boosts this capability to realize even higher resolutions in 24 bit color (16,777,216 colors per image).

Using Expos
and APEX Media to capture live video in real time allows a sequence of images to be compiled into an animation, which can then be played back within APEX Media or stored as FLC/FLH file.

The Non Linear Drawing Tools:

Realistic airbrush with flow control (ink and mask
Fill
Draw
Analog Mask Options. This is used to define a color or area for processing.

The Film and Image Filters:

these are tools that can be applied over a selected area on any number of frames automatically.

Noise Suppression
Image Dejag
Motion Suppression

The Morphing and Distortion Workstation:

Apex Animator contains a very powerful morphing module. Here an image can be morphed into an other over a sequence of frames to produce a smooth effect. defined warplines can be saved on disk for later use.

The TEXT Interface:

This allows the use of Calamus vector fonts. Character space and size can be defined. (I would like to see in future updates the support for truetype fonts)

The Manual:

Apex comes in a nice box with a well written manual. The manual has overview and in depth sections describing each module and tools. It also describes image and compression formats as well as some tips on creating neat effects using the available tools. The sample disks contains sample images and small FLC animation files created with Apex.
I got news from Titan Design that they are working on a new version of Apex Media that will incorporate some Cyber like features and possibly audio. My advice is:

If you are into graphics get Apex Media Animator.
Available from TOAD COMPUTERS:

Apex Media
Multimedia Graphics Software$149.00 Apex Media Lite
Lite Version of Apex Media$59.95 Expos

Expos

NTSC Video Capture Hardware$399.00 Expos
with APEX Media
Multimedia Graphics Software$548.00

Well, let's look at the facts. You said I needed remedial English classes, which effectively gives me carte blanche to "analyse" your grammar and spelling. If you're implying that I was only doing it because your arguments are watertight, you're seriously mistaken. If you had only made the comment in the first place because I don't happen to agree with you, other people's recent postings would indicate that you've got some extra work to do.

Isn't it funny when you think you're making a strong pro-Atari argument in an Atari newsgroup, but nobody backs you up? It would be enough to make a reasonable person wonder if they'd got their facts straight.

```
Toad Computers Announces New E-Mail Mailing Lists
-------------------------------------------------

Toad Computers is pleased to announce two new email mailing-lists aimed
specifically at Atari owners.

They're called ST News and Jag News and they're the best way to get timely
information about the latest products for the Atari ST/TT/Falcon computers and
the Jaguar and Lynx Game Systems, respectively.

To subscribe, simply send email to:

majordomo@lists.toad.net
OR
majordomo@lists.toad.net@INET# (from Genie)

and include the following line in the body text:

subscribe stnews
OR
subscribe jagnews

For more information about the list before you subscribe, use this line in the
body text:

info stnews
OR
info jagnews

ST News and Jag News are moderated lists and will only contain posts from Toad
Computers staff. You won't get a huge volume of email -- probably one to three
messages per week on average. Posts will be sent directly to the email address
you use to subscribe to the list -- on any online service from Genie to
Compuserve to AOL. The beauty of an email mailing list is that it is simple --
it does not matter what service you have or whether you have a graphical web
browser.

ST News and Jag News will also contain special prices and promotions that will
be available only to list members.

Several hundred people have already subscribed to both ST News and Jaguar
News, and we hope you can join us too! Please subscribe. It's free, of course,
and you can always unsubscribe by sending "unsubscribe stnews" OR "unsubscribe
jagnews" in the body text of a message to majordomo@lists.toad.net. We think
that whether you're a customer of ours or not, you'll find our news service to
be the best in the Atari community. We firmly believe that the best way to
make a sale is to tell the truth, and ST News and Jag News will never contain
```

anything other than what we have verified to be true. We look forward to seeing you!!

Dave Troy

I assume you mean NNTP?

Ensure you have the name of the news server you want to connect to and
also the address of a server which can resolve that name into an
address. Ask your provider for the address of the domain name server
(DNS) and news server.

>As far as Mountain, I believe that my system does not support QWS or
>whatever format it uses. I view Netnews on a CMS mainframe account.
>Does anyone have a recommendation?

I'm lost here.

>As far as HSMODEM(?) goes, I don't use it. Do I need to with a 2400
>baud modem?

You don't need HSMODEM with NOS but I've not had STiK work without it
myself (and I shouldn't need it either) - it won't do any harm to try
it.

Mark Baines has written a book called "The Atari A to Z". This has details on most, if not all ST/TT/Falcon etc ports and connectors, as well as much more information on Atari computers.

I know he has some copies left, but maybe not many. You can email him as "msbaines@cix.compulink.co.uk".

No great reason to be surprised. I've been doing it for years.
I found the old supra Utils the best for this work as they allowed you to
play around with all the potential information. You go to the swap meets
and find a 20 meg MFM drive for $5, take it home and format it out to
40-45 most of the time. Then when it dies in 6 months you just put
another $5 wonder in. I used to be able to tell you exactly why this is
possible. But it's faded from my memory unfortunately. If I remember
correctly it had to do with RLL drives and crappy MFM drive controllers.

Source record: 151695

I'm ready for a bigger system (than a STE) now and it seems to me that an interesting solution might be to buy a PC or Mac and run an emulator. I would appreciate any comments about the stability and compatibility of such systems. How do they behave with peripherals? Are they compatible with all software, most of them or just a few? (what about games?). What are the minimal system requirements? In other words: Is it worth it?

Thanks for your help, (feel free to e-mail me)

I referred to a ST C compiler "with full GEM libraries", and I suppose that could be taken to mean that you can have an ST C compiler without GEM libraries - which you most certainly can. I could delete the GEM libraries from my GCC setup and still have a working C compiler. I may even have had to install them separately in the first place. It's not an absurd notion at all, unless you're still not quite au fait with this libraries lark.

For your information, the GEM libraries I have are gem.olb and gem16.olb (the 16-bit integer version). Each file is about 80K, making a grand total of 160K. That's a tenth of your 1.5MB gone already. This is not code which is duplicated in the operating system, despite what you appear to believe.

>|And to suggest that you could avoid the need for GEM libraries by using
>|inline assembler is absolutely ludicrous. You could do the same with
>|Windows if you could really be bothered. So what's your point?
> You'd have to know where they are. 80x86 is a bit nasty as assembly
> goes.

Doesn't mean it can't be done, though. I'd be very surprised if the method for calling Windows functions was substantially different from that of GEM.

>And all that the 'GEM' libs do are 2 pushes and a trap.

Er, not exactly. The GEMDOS, BIOS, and XBIOS functions are more or less that simple, but the AES is quite a bit more complicated. Here's an excerpt from Compute!'s excellent Technical Reference Guide, "Atari ST: AES".

"It's much easier to make AES function calls from C than from either machine language or BASIC. That's because C compiler packages for the ST include one or more function libraries known as GEM bindings. These bindings are object-code library files that define a separate named function for each GEM call. When the C program is linked to the proper library files, it can call GEM functions as if they were part of the C language.
[..]
int dummy, shape = 3;
graf_mouse(shape,&dummy);
The function defined as graf_mouse() in the library takes the parameter

`shape' that's passed to it, puts it in int_in(0), and puts the address of the parameter `dummy' in addr_in(0). It also puts a 1 in control(1), control(2) and control(3), a 0 in control(4), and places the command opcode (78) in control(0). The function graf_mouse then loads registers d0 and d1 with the proper values and executes a TRAP #2 instruction."

Two pushes and a trap? I don't think so. This is why you need a library.

I believe that some compilers have extra GEM libraries available which give you the neat stuff you usually only find in Windows or Mac applications, like "radio buttons". I'm sure there was a German add-on like this for Pure C, for example.

>
>1) Can the memory be upgraded and if so how high.

Yes. 1, 2 or 4Mb.

>2) What's the deal with these monitor resolutions.

Uhhh....
Low and Medium are available on colour monitors or TVs (if the atari has 'm'
in its name: ie stfm). Mono is only available via a dedicated monitor such
as the SM124/125 or a multisync monitor. The resolutions are as follows:
High 640 x 400 2 colours
Medium 640 x 200 4 colours
Low 320 x 200 16 colours

>3) Can you hookup a cdrom, what about a hard drive.

Yes and yes. You need a SCSI host adaptor though. The ICD Link 2 is good, &
costs about 70 UK Pounds. Only SCSI devices are supported!

>4) Is there oop programming languages out for it ala c++, Visual basic.

Don't know, but I don't think so. More knowledgable people than me will no
doubt correct me if I am wrong :o)

>5) Can I ftp atari programs to my pc then copy them to a 720k floppy
>and use it.

Yes.

>6) Is there any user groups/bbs in Georgia or Florida.

Don't know. I'm in Scotland :o)

>7) Can someone tell me what is rainbow TOS and what the latest release
>was.

Rainbow TOS is the TOS in STe's. The latest version put into STe's AFAIK was
1.62. 2.06 is now available & is recommended. However, many people will
advise you to dump TOS & go for Magic. Again, more knowledgable people will
undoubtedly put you right here.

m>
m> Hello Falcon users....
m>
m> Tell me about the Modem port on the Falcon 030.....
m>
m> Why is such a tiny thing...and most modem cable adapaters are
m> much larger than that? Do I need a special sort of adapter to make
m> my 14.4 modem fit in that tiny hole?

The 9 pin D socket is pretty much standard on PCs, and little 9 to 25
adaptor is all it needs, if your modem lead's not already 9-25.

I've a supra 144LC and it came complete with necessary adaptor. :)

Piece of cake.

C > get the data, there's no way to convert it into MS-Word,
C > Excel, etc. Any ideas? Please respond here or to me in email
C > at: crave@buffnet.net Thanks!

Well, according to Ralph Turner (Third Book, chapter 14), the commonest formats for database records are comma delimited and fixed length records. You need to ask yourself 1) 'what format is BaseTwo?'; 2) 'what format(s) will BaseTwo export in?'; 3) 'What formats will DOS box databases import in(?)'; and so on. You may go through several programs on each computer before you get to your final destination. OTOH, BaseTwo may have an odd native file format, and no other format for export - in which case you're gonna bang on your new keyboard for a long time. Hope not.

One other hint: Dan Wilga wrote a database converter program so that Cardfile could import other addressbook files directly. It's on the Cardfile4 disk. If at some point you end up with comma delimited files, Dan's program will juggle the fields for you.

WH> Plus some years back. This would be neat to have for some of
WH> the cheap older MS-DOS notebooks which are now becoming
WH> available. Did this version exist? Is it for sale?

I never saw it, if it existed. However, WordWriter PC from TimeWorks
definitely exists. I've seen it. It has been a year or more, but it
was available at a local store. I'm not sure whether it was a
Windoze or a DOS program, but I'll bet it was DOS. WordWriterST is
very similar to FirstWord+, and would make a good choice. I
think even the file formats are the same.

Source record: 151805

Look for the Toronto Atari Foundation (TAF) distribution kit containing
MiNT and X11. Be aware that on a 4 MB MSTE you will end up with less
than 2 MB of memory by the time you have X11 and a shell running, so
don't expect to have xclock and xbiff and umpteen applications running:
it's enough to have ftp running in one window and sh in another. :)
Lynx runs fine, but Chimera runs out of memory on any page with >10KB
of graphics. :(

> Does anyone know of a way of automatically cycle through phone numbers
>in Oasis/NOS, as in CAB/STik? I'm using four dial scripts at the moment, which
>gets a bit painful!

Yes I know a way to do it with NOS: in the DIAL.TXT file, set multiple
number "123456\r" lines with every call number you have, and set the
retries value upper. Each time, after a 'BUSY' number failure, NOS will
try the next number.

sample extract of a configure section from a sample DIAL.TXT:

```
configure:
init "AT/Z\r"
dial_cmd "ATD"
number "20918780\r"
number "20918781\r"
number "20918782\r"
retries 3
```

>Internet.
Well said Alfred! Perhaps you should copy your message to both of them in
case they missed your post.

>2) the best thing would be, if some of those programmers could team up
>and melt their programs into one.
This can be notoriously difficult especially if they have already cut code
and have different designs. However talking to each other might result in
better solutions. Programmers often understand one part of an application
better than another, together they might understand the whole thing.

>I don't think people need 5 to 6 new AES replacements,
Right, but who is doing the other 3 or 4?

>3) If 2) shouldn't be possible (at least let's say to have just 2 AES
>replacements), the next idea would be for the programmers to
>have "Meetings" on a periodical basis ti implemnet AEs standrads.
Steady on Alfred, next you'll be suggesting an ANSI subcommitee :)

I still get run-time errors with WWW 108. One thing I have noticed
is that one time when I was using my sample editing software I also
got a run-time error. Ther message I got in addition was that the DSP
port was in use. I was wondering if the source of the runtime error
has to do with interference from the DSP?? If those who are more
technically inclined think this observation may be right, is there a
way to "disconnect" the DSP while using CAB??

and I no longer use the chameleon because a) it doesn't work with MagiC and b) it's not needed anyway.

The only thing I can mention is this. My system used to be very stable then over a period of three or four weeks became progressively less so. The applications which I had installed in AUTO\ACC (the MagiC autostart parallel ones) would randomly bomb out.

Fortunately, I had written these myself so I knew there was nothing wrong with them. Unfortunately, I had also got some new CPX's and resorted the AUTO folder at the same time (plonker). Removing them and restoring the auto folder order again did not help a bit.

The culprit was XCONTROL.ACC - I have no idea why and I can't track it down but as soon as I replaced it with ZCONTROL, no more crashes - not a single one, even with the new CPX's installed again.

Just one of life's little mysteries :-)

I just bought this up because I was curious if this would be a alternative
that someone might be interested in looking into coding. I am honestly not
very familiar with the SLIP/PPP protocols except from what I've read here
concerning setting up CAB/StiK, but the setup for SlipKnot was pretty easy.

I glad some people here took my post for what it was/is, unlike a certain person who e-mails me calling me a IBM fanatic who has finally seen the web in color (martinr@???.ca ?). I tried to e-mail him, but my server could not recognize his address. Glad some non-ignorant people understood my post.

I just inherited a old atari 520st and I have many questions

about it. First I would like to thank anyone answering it would be

much appreciated. O.K., so here it goes.

1) Can the memory be upgraded and if so how high.
2) What's the deal with these monitor resolutions.
3) Can you hookup a cdrom, what about a hard drive.
4) Is there oop programming languages out for it ala c++, Visual basic.
5) Can I ftp atari programs to my pc then copy them to a 720k floppy
and use it.
6) Is there any user groups/bbs in Georgia or Florida.
7) Can someone tell me what is rainbow TOS and what the latest release
was.
Again any answers would be a help, I don't have any docs or software
for it.
Thanx

Source record: 151897

Flash II version 3.x is a fully windowed terminal program supporting all
the ports your machine has. Built in RS232 fixes so all works without rs232
patches. Scripting similiar to Flash 1.x, but enhanced. Geneva and Multitos
compatible. Will even run blind with NO TERMINAL WINDOW to redraw with
a proper script. 100% Gem full ansi on proper resolutions, emulated in Alan Page's Flash is
two generations behind. Been using various versioins Been using various versions of Flash
II since april 1992.
lower resolutions, than TTmed. [requires 80 col. resolution STlow/TTlow are
out]. Screen Accelerator recommended with stock ST's. Nine built in protocols
for dl/ul including Zmodem. VT100,vt101,vt102,vt200,vt300 emulation.
TWo text editors if off line. An umlimited except for memory typeahead
command entry window. [Serves as a second editor when off line. This reply
written in the typeahead window while observing your message in the editor.
Works well with 28.8 modems.

BB
Kevin Scruggs said:
> void with no params
> move.w #10,-(sp)
> trap #AES_CODE
> addq.l #2,sp

You are wrong. You stuff the intin,addrin, and control arrays of the AES
and then trap #2 the address of the parameter block array in a0 and some
constant in d0 before the trap #2. No stack cleanup from trap.
EXAMPLE: int form_do(OBJECT *,int); with 16 bit ints.
move.w 6(sp),__AESintin
move.l 4(sp),__AESaddrin
move.l #form_do_constant,d0
jmp __AES_if

will do with Lattice C, __AES_if fills control array, and traps to aes.
this trap has parameters, aes parameter block address in a0 and a constant
I forget in d0. No stack clean up. Uses movecp or something like that to
move bytes of d0 into words of control array.

aes_init() is simply
move.l #aes_init_const,d0
jmp __AES_if

with this convention. Every AES call requires a stuffing of the control
array. Makes sense to make a subroutine out of that. Some compilers
use _crystal for this.

Hi, everybody. Esscode has been taking a licking in this newsgroup, a bit, so I thought I would pass along a peculiarity that I just found. Peter Missel posted a file here that I originally thought was Mime, but turned out to be UUEncoded. However, I kept getting reports from Esscode that the file was the wrong length; eventually I gave up on it.

Yesterday I was browsing my hard drive, when... lo and behold, there is a folder in the esscode folder labeled IPRN46.LZH - and it un-lzh'ed to Mr. Missel's print accelerator, although one of the doc files was a little truncated. So I guess esscode, like the Christian Deity, works in mysterious ways :-). But it does work.

IIRC this is the Monulator, which is a mono emulator. Don't know about more resolutions. You might also try the virtual sceen driver BIGSCRN (needs TOS 1.4) or for the STe there is MONSTER, which does the same thing but takes advantage of the STe hardware scrolling.

Sorry if it is not much help.

HT> I'm a little confused about all the different versions of NVDI-
HT> they all seem to have different features and some don't work
HT> with certain programs. Should I get the latest version if I buy
HT> it, or are there different features in the different versions?

Hello Hallvard,
If you have a 4MB Falcon, it could be hard to use a later version than 2.5. All you need is the screen accellerating and that's what's in it.
The later versions can cause problems because they use a little more RAM space and the audio engine won't work in Cubase Audio if not enough memory is free. However, to keep to compatibility and the best features you should get the latest. If you have a 16MB Falcon, there is no problem at all - get the latest!
In the later versions, there is support for truetype and GDOS fonts when working in programs that support NVDI or GDOS. Cubase Audio doesn't use NVDI or GDOS. I have version 3.01 if my memory doesn't fail me, but the latest one is 4.0 .

>un-lzh'ed to Mr. Missel's print accelerator, although one of the doc
>files was a little truncated. So I guess esscode, like the Christian
>Deity, works in mysterious ways :-). But it does work.

Also contrary to an article read the other day I found that base 64
encoded mimes are decodable on an Atari. I had just finished penning a
reply to a poster who had not only posted binaries to a non binary
group about the irritation of large download times PLUS the innability
to view the dammned things when I tried esscode with the extracted
article and, quick as a flash, an A1 jpeg sat in my esscode folder!

Nice! It converted quicker than Apex jpg viewer took to load
it.(fast)
(no it was a picture of a kite from rec.kites ...honest!)

Might have to register it after all.

Maybe other companies than C-Lab can develop Falcon-clones if Atari dies.

Just a theory.

And WizzTronics can release their running Falcon-clone to the public.

If the Syquest is in an external case with 2 50 way connectors on the back
you can connect it direct to the Mac with a Mac 25/50 way SCSI cable (as
also used with Atari TT).

If you have other SCSI devices connected to the Mac you can use a standard
50/50 way SCSI cable, but you may need to change the Syquest SCSI ID.

I run MultiTeX under MagiC 4 and it runs fine.

Instead of using the edit-option from TSH.PRG when editing a .TEX-file,
I just start a texteditor from the desktop and leave the .TEX-document
open in the editor. And when I wan't to compile the .TEX-doc I just switch
to TSH.PRG and press T to compile. And while it's compiling I can continue
with whatever I wan't.

From: fsctc@lerc.nasa.gov
Message-ID: <4ekcu6$lie@flame.lerc.nasa.gov>
Source record: 151715

I recently purchased a copy of AtariWorks. Since it was a closed-out
item, it didn't come with a manual. Does any one have a copy to spare?

Secondly, what version is AW up to now? What importing formats do
its spreadsheet function contain? Are there anyway to "freeze" the
columns and the rows as headings?

1967. FS: Atari MegaSTE system

Newsgroup: comp.sys.atari.st
Date: 1996-01-30 00:00:00 UTC
From: awatson@pacifier.com
Message-ID: <4ekd8v$ne5@news.pacifier.com>
Source record: 151716

For Sale:

Atari MegaSTE, TOS 2.06, 4 Meg RAM
1.4 Meg High Density Floppy Drive
Internal 105 Meg Quantum LP105 Hard Drive

Pair of WICO Boss Joysticks

Custom monitor switch (switch between the Ataris Color/Mono Modes,
and a standard VGA output from a second computer). I used this with a
multisync monitor.

Atari Works, Wordflair II, Club Dominoes, DMJ GIF, Easy Draw, Crackart,
Universal Item Selector, Newdesk Icon creator CPX, Diamond Back 3,
and a wide assortment of PD/Shareware/Clipart. (I'm keeping the majority
of my software collection for use on my other system).

This machine was purchased new and has been used for software development
by Mountain Software. It has been well cared for, and is in great condition.
The keyboard membrane was replaced just a few months ago.

Asking $600 OBO. I "DO NOT" want to part this system out. I'm only
interested in selling the complete system.

Contact Anthony Watson at (360) 694-1880 if interested
(9am-4pm PST only please)

Or, leave E-mail to: awatson@pacifier.com

For starters! You don't need jar10 if you have tos 2.06. I think it is only needed for tos 1.4 or older, and I might be wrong on 1.4! I know for a fact that ledpanel causes problems in certain circumstances, but don't know if it is contributing to the specific one you have or not!

Yes, up to 4 Meg, but not easily or cheaply.

>2) What's the deal with these monitor resolutions.

The Low and Medium resolutions can be used on the color monitor or TV.
The high resolution requires a special hi-res monitor (or may be adapted
to use VGA).

>3) Can you hookup a cdrom, what about a hard drive.

Yes and yes.

>4) Is there oop programming languages out for it ala c++, Visual basic.

The GNU series (i.e. g++)

>5) Can I ftp atari programs to my pc then copy them to a 720k floppy

Yes.

>6) Is there any user groups/bbs in Georgia or Florida.

Don't know, but should be.

>7) Can someone tell me what is rainbow TOS and what the latest release
>was.

TOS 2.06 was the last version. Either upgrade to that or one of several
replacement OSs.

FX-card, Magnum and AfterBurner040 all have 72-pin SIMM options.

A standard FX-card has 30-pin sockets, but an additional card can be attached
which also has 72-pin sockets.

> SM> (and I couldn't live with less)

Maybe not a standard Falcon, but a slightly modified Falcon can.
And my FX-Falcon can 1024x768 in 256 colors easy.

Actually I'm running that mode under MagiC 4 occasionally, but mostly I
run in 800x608 in 256 colors. 1024x768 is too small on a 14" monitor.

> Couldn't live with less? Some PC users don't go higher than 640*480, which is

Dennis McGuire <mcguired@moose.erie.net> inquired plaintively:

M > What problems does Warp 9 cause with STorm? Maybe that
M > explains some of the "weirdness" I've been encountering on my
M > Mega STe!

Well, I briefly tested STorm and found that the windows would cycle each time the screen saver started. And maybe other times, but organic memory dims. After determining that it was Warp9 that STorm didn't like, I chucked STorm. Later I checked Flash 1.6, which was co-written by the author of STorm (Alan Page). Same story - windows cycling automatically.

I never tested these prgs thoroughly with and without Warp9, so I don't know if there are other things that happen. What 'weirdness' are you experiencing?

> Could you please explain what bug has NOS with binaries postings? I
>never tried so far to post UU or mime articles, but isn't it just text?

Anything containing a '%' character stands a good chance of being
corrupted. For those who don't know C ...

The printf() statement and associated functions take two or more
arguments. The first is the format string.

printf("Value=%d",5) will print Value=5 on the screen.

Unfortunately, it is all to easy to just print text with

printf("Hello there") whereas printf("%s","Hello there") is the
correct way to do it.

There is a line in NOS 0.42 which prints a string variable as the
first argument so whenever this contains a % the routine trundles off
pulling non existent arguments out of thin air, hence the corruption.

There is a fix: type %% whenever you want a % because the printf()
takes this to mean you really do want to print a % instead of having
to introduce the argument type and format.

So unless you want to go through your encoded stuff doubling up all
the % you can't do it.

You may be able to email news by comp.sys.atari.st@news.demon.co.uk
adapting it for your provider accordingly.

You must format your disk in MS-DOS mode (720Kb if you haven't High
Density drive on your Atari) so both Mac and ST will read the disk...

Not just using C you won't, I agree that using all the graphical "programming"
tools Jan-Olof seemed to be advocating you might, but C can be very compact,
particularly if you're careful not to use unnecessarily large library routines.

>Eventually you'll need about 500 meg just for the Operating system cos people
>used a C compiler, originally compiled usinga C compiler, originally..

What the C compiler is written in is irrelevant to how good it's output is. It
might affect how fast it runs but the speed of the generated code is not
affected at all by what it is written in.

Oh, and almost all C compilers are written in C. Normally compiled on themselves
although the first versions will obviously be compiled on a different compiler.
You would have to go back a long way to find a C compiler that wasn't written
in C.

>> WWW programming tools exists today).
>
>Is this a good idea? The thought scares me..

Yes, and me. You look at some of the PC stuff written in visual basic, how slow,
how large and how shoddy looking it is, and that's almost a proper language.

The aif file format is quite flexible, and you can specify that blocks of
it should be played out of order etc, to allow for faster editing. I
suspect 525 only works if it has to play straight through in order.

whilst this may be true, we end up with the bloat code that PC owners
seem to love. Eventually you'll need about 500 meg just for the
Operating system cos people used a C compiler, originally compiled using
a C compiler, originally..

If thats the future you see, I'm glad I code 68k.
Ok, It isn't easy, but it produces SMALL executables..

Yes, I use these. They get "deeper" than other utils.

b> I used to be able to tell you exactly why
b> this is possible. But it's faded from my memory unfortunately.

Maybe the inner cylinders of ancient discs were just not very reliable
anyway (primitive coating, low head velocity etc.) so manufacturers would
only "sell" the outer cylinders? .....

On 29 Jan 96 marksh@freenet3.scri.fsu.edu wrote:

Hi Mark,

m> 1) Can the memory be upgraded and if so how high.

Yes - to 4Mb. The best way is to get the Marpet Xtra RAM board which you can then populate with conventional SIMMs.

m> 2) What's the deal with these monitor resolutions.

For High res. you need a special mono monitor which can cope with the high scan-rate, they are known as SM124 SM125 etc. Plenty around second hand and the only type to use if you are doing a lot of word processing, DTP etc. Low and Medium res support 4 and 16 colour pallettes

respectively - you will need a conventional RGB monitor if you are going to use games.

m> 3) Can you hookup a cdrom, what about a hard drive.

To do this you need to get a "host-adapter" which plugs into the ST DMA port. This will allow you to daisy chain 7 or 8 SCSI devices. Each type of device will need a special s/w driver.

m> 4) Is there oop programming languages out for it ala c++, Visual
m> basic.

There is C++ (by GNU) but you will need at least 2Mb RAM to use it.

5) Can I ftp atari programs to my pc then copy them to a 720k
m> floppy and use it.

Yes. Just make sure the floppy is formatted to 720kb.

m> 7) Can someone tell me what is rainbow TOS and what the latest
m> release was.

Rainbow TOS was the name given to TOS 1.4 (which is fine!). To use a higher TOS you would need to do h/w mods.

When you have a bit more store think about getting MagiC (a replacement operating system) which is quite a bit faster (among other things) than TOS.

Good luck, have fun.

Hi all!

First of all: Thanks to all of those who mailed me the hint with the newdesk.inf!

I did delete my newdesk.inf and built a new one. And indeed it was amazing: The speed-problems vanished imediateley. Pages and graphics are built up very quickly now with my DTP-program. All actions are execised very well and quickly. Actually I noticed, that the extreme slowdown two weeks ago seemed to be only the the famous drop that filled the barrel (at least in germany we say so ...). But the machine must have run with reduced speed for a much longer time - but probably it came up slowly but increasing more and more - so that I got used to the speed-loss without really realizing it. I think I had forgotten how quick my Mega STE was in the past!

Right - everything seems to work fine again.

Happy and thankfull!
Andreas

Yeah, at my FTP site. FTP to: ftp.sn.no /user/hallvart/atari/

I think I've named the file 'm_inf242.zip' (Menu info 2.42).

2002. TT Rez Emulator

Newsgroup: comp.sys.atari.st
Date: 1996-01-30 00:00:00 UTC
From: HQBA73D@prodigy.com
Message-ID: <4ek32t$1p3a@usenetw1.news.prodigy.com>
Source record: 151812

I read an advertisement a few years ago (I think it was '91 or '92) about a program that you could run on any ST and get the same resolutions as a TT030. It was done by a company called Moriarty Software (once again I'm not quitet sure) It was located somewhere in England. I'd LOVE to get my hands on this software, if anyone could get me the information on this it'd be gratly appreaciated.

2003. vhd partitions

Newsgroup: comp.sys.atari.st
Date: 1996-01-30 00:00:00 UTC
From: Eric Palm <darkforc@darkforc.tiac.net>
Message-ID: <4ejrd7$440@sundog.tiac.net>
Source record: 151813

Having had an Atari withthe ICD utilities, I was able to
get larger than 32 meg partititions even with TOS 1.2.

The ICD utilities let you reformat your drive using larger than
512 sector sizes. I was wondering if there was a way to
trick HDX utilities into using sectors larger than 512 bytes,
so you can get much larger than 32 meg .VHD files.

There are still programs like Neodesk 4, that want the VHD
files, and if you install the Mint distribution for a.a.u.e
and want to use the Minix file system, you have to use .VHD
files also. It would be nice to have them as large as I want.

Anyhoo, thanks for the web page access, I appreciate it.

I just got the Gemulator 4.11 + beta for 1/26/96, and will
give it a shoot.

A suggestion... You made it possible to have access to the
A: drive while in virtual drive mode, where I couldn't before
in Gemulator 4.0 I was thinking of maybe you having an option
for each partition be either a .vhd OR IBM compatible mode, so
I could access, say a virtual drive C: .VHD, and drive D: would
be an IBM drive, drive F: would be my CD ROM etc.

Would be helpful when moving files to and from the two
environments, escpecially when running Mint.

Not to stroke your ego, but I'm considering buying Calamus SL
now, as the price is right, the speed is faster than my ST, and
I have access to clipart on CD, as well as the enhanced VGA
resolutions of Gemulator.

Thanks a bunch, and I'm sorry for the day to day e-mailing, I
was just very anxious to see the improvements you mentioned in
the card.

Eric

2004. UK User Groups

DM> I was wondering if anyone had a list of UK User groups for the ST and
DM> if anyone had any recommendations/warnings about any. I used to be in
DM> the National Dragon Users Group which was brilliant but there seems
DM> nothing similar for the Atari platforms.

I've seen others have got back to you before I've seen this (my feed went down the other day) and that Alasdair Goold has got back to you regarding his West of Scotland Group, which is the closest to you that I've got a confirmation of.

If you want a National list you can write to me at the following address:

49 Haywood Road
Tile Cross
Birmingham
B33 0LJ

You *MUST* include an SAE and a disk to get the list otherwise I quite simply will not reply (I've had a few without and I'm calling a halt to supplying info to others at my own expense, let alone time).

If you have any specific questions I'll try to direct you at the best source for an answer or do my best myself.

==========
Contained on this disk are the following files: Total size 634Kb

README.1ST The file that you are reading now.

<FILE_REA.DER> folder
RDD.PRG The Revenge Document Displayer v3.20. A program that enables you to read all the text files on this disk. Contrary to the information supplied in the accompanying documentation this program is now unsupported shareware as the author has left the Atari scene.
RDD.TXT Full instructions for the use of RDD.PRG
<PRINTER> folder
EPSONFX.RDD 9-pin Epson FX printer driver for use with RDD
KXP1081.RDD 9-pin Panasonic printer drivers for use with RDD
STANDARD.RDD Basic printer driver for use with RDD

STARLC24.RDD 24-pin Star LC24 printer driver for use with RDD

<GEN_INFO> folder
GLOSSARY.TXT Glossary of technical terms used on Atari computers.
USER_GRP.ASC Tutorial series by Ron Whittam and first published in Atari Explorer Online (AEO) disk magazine on the subject of User Groups - how to start them up and keep them relevant and interesting to members. Recommended reading.
YR_2_MAN.TXT Your 2nd Manual for the Atari ST by Andreas Ramos. An essential read for new users struggling to get to grips with the Atari ST. Many references are out of date, but the basic principles of what can be done with an ST are just as valid today. Originally published as a book, it was my own most useful reference guide when I started with a 520STFM in 1988. Also, very witty! Essential reading.

<LISTS> folder
AAUG.LST The latest User Group guide - constantly being updated as information comes to hand. Where groups are listed as *unconfirmed*, please be careful when trying to make contact. It's quite possible that the contact phone number of address is out of date, so you may be speaking to someone who has no idea what you are asking of them. When contacting groups from the *confirmed* list please provide an SAE as a matter of courtesy and a disk if required. Most groups are non-profit making, so they don't have unlimited funds to be supplying information and disks to all and sundry.
ATARIANS.ASC A list of Internet EMail addresses of prominent Atarians. Mostly in the USA, but also many of interest to us in the UK. Note that the list was accurate at the time of compiling, and as ever these things are prone to change.
FTPLIST.TXT A list of Internet FTP sites. These are file stores of Public Domain and Shareware programs as well as text files, MIDI files, picture files and the like.
HOMEPAGE.ASC World Wide Web sites created and maintained by Atarians. The sites themselves may relate more to subjects of interest to them rather than information on Ataris, but they will be accessible using the Internet Access software package (CAB/STiK).
NESTBBS.TXT A confirmed list of Atari specific BBS's containing file lists and message areas specific to Atari computers and related issues. These are free access boards run by Atari owners. Please be especially sure that you adhere to any time restrictions in effect.
NESTMAP.IMG A topographical map of the routes taken by the NeST (Network ST) BBS network.

<SHARWARE.SUP> folder
INTERACT.TXT Supported shareware under Joe Connor's Interactive scheme. Latest version numbers, prices and contact details.
CYBERSTR.TXT Supported shareware under Denesh Bhabuta's CyberSTrider

scheme. Latest version numbers, prices and contact details.
==========

Any follow up enquiries might be better in EMail.

Also, David, please confirm your EMail address as it's not clear to me what
it is from your message.

2005. Migraph Wand B&W Scanner for sale

Newsgroup: comp.sys.atari.st
Date: 1996-01-30 00:00:00 UTC
From: Bob Young <74747.2015@CompuServe.COM>
Message-ID: <4ekdrc$5pa$2@mhade.production.compuserve.com>
Source record: 151815

I have a Migraph Wand scanner for sale. It's nice because you
cover the full width of a sheet of paper with one swipe.

Resolution is variable up to 300 dpi, with settings for photos
and line art.

Plugs into the cartridge port.

Comes with Touch-Up and OCR software, as well as power supply.

Approx. two years old.

I paid $400, but you can have it for $200.

Please email me if you are interested.

Thanks.

Bob Young

As I understand it what Moriarty Software actually produced was a ST
Monochrome resolution emulator for those with only colour monitors.

2010. Bug in CAF <> 525 sample conversion

Newsgroup: comp.sys.atari.st
Date: 1996-01-30 00:00:00 UTC
From: istvan@innet.be
Message-ID: <4el2ek$1mo@news.be.innet.net>
Source record: 151820

Hye...

I would like to use the 525 utility to convert CAF files, and such.

If I record a file in CAF (aif), then process it through 525 all is
ok!

But...
If I use either [erase unused, pool] and/or offline editing, the
result of this is that 525 won'r recognise the fila anymore.

Is this a shortcoming in CAF or 525?
Anyone eles noticed this?

Bye!

2011. Re: MPEG-packed sound?

Newsgroup: comp.sys.atari.st
Date: 1996-01-30 00:00:00 UTC
From: istvan@innet.be
Message-ID: <4el2ec$1mo@news.be.innet.net>
Source record: 151821

A Falcon owner myself, (for work CAF) and PC user (Other) I have been looking for exactly the same for a while now. Previous posts never got reactions. Anyhow, I knew more people HAD to want this too. So...

thietavu@news.abo.fi (Tommi Hietavuo TKKK) wrote:

> I just wonder, whether Falcon's DSP would be capable of creating and
> playing such MPEG-packed .WAW-files some PC- and Mac-applications
> produce..?

Such soft is already available on the PC platform. Several amaof.
L3 is one such package:

(from info file)
>The Layer 3 Shareware is copyright Fraunhofer - IIS 1994, 1995.
>The shareware packages are available:
>- via anonymous ftp from ftp.fhg.de
> You may download our Layer-3 audio software package from the directory
> /pub/layer3

Also:

>For PCs running Linux:
>l3v200.linux.txt short description of the files found in
> 3v200.linux.tar.gz
>l3v200.linux.tar.gz encoder, decoder and documentation
>mp3-bitstreams.txt short description of the files found in
> mp3-bitstreams.txt
>mp3-bitstreams.tar.gz sample bitstreams (same as l3v200d2.zip
> but as a .tar.gz file)

I don't know if this last one would run on a Falcon under Linux. I'm sure it wouldn't make use of the DSP power to encode/decode.

Maybe these people could be enticed to write a Falcon specific version?

This is their email adress: layer3@iis.fhg.de
And website: http://www.iis.fhg.de

Lookin forward to reactions on this...

Walter Hellman (hellman@teleport.com) wrote:
: Hi,
: I was wondering if there are any old Flash users who switched
: over to Flash II, which I understand was just upgraded last summer.
: What's the verdict? What do you gain? What do you lose?

: Any opinions appreciated.

Gain: Features, features and more features, plus a few enhancements to the DO scripting language and a much more powerful dialer. You also get a very smart cerlox-bound manual and tech support from John Trautschold. In version 3.0 you also gain full multitasking ability under Geneva, Magic or MultiTOS or, if you use 2.23 (which also comes in the 3.0 package) you can get background transfers with a small AUTO program called Silent Line. (No support for Zmodem in SL though)

Lose: (in v3.0) Speed; 3.0 is very slow at screen updates due to the fact that it has to give time back to the processor for multitasking users. You can use 2.23 for greater speed, but you lose the enhancements in 3.0 then.

If an ATari store near you sells Current Notes magazine, I did a full review of Flash II 3.0 in November/December's issue. :-)

Josh Spatz (mjkv57c@prodigy.com) wrote:
: I have never heard of Atari Computers other than the 8 bits they made in
: the 80's. Just recently I heard of the ST and Falcon. What are they? Are they
: like Amigas? Macs? PC's? Are they still made? Where can I get one?

They're like a combination of Amigas and Macs, I guess you could say.
Low- to High-end Amigas correspond for the most part to low- to high-end
ATari machines, though it should be said that Amigas were for the most
part one or two steps ahead of Atari in terms of capability. (i.e. the
original Amiga 500 had a multitasking OS and 4096 colours, whereas the
original 1040STFM only had a singletaskiing OS and 16 of 512 colours
displayable) Atari's last machine, the Falcon030, is roughly analagous to
an Amiga 4000 with a slower processor, but with the adddition of a
Motorola 56001 32MHz DSP. Atarri no longer manufacture computers, but
clone manufacturers (C-Lab Falcon Mk X, Mk 1 and Mk 2, and the Medusa T40
by another company) continue to manufacture high-end atari clones.

: I heard a number of people referring to the 'Tramiels' running Atari. Are
: these the same Tramiels from Commodore?

Yes. Jack left Commodore and bought Atari from Warner Communications in
1984. Jack then retired in 1987 or 88 and left the company to his sons,
Gary, Sam and Leonard; together, these three have really screwed Atari up.
Atari's latetst project, the Jaguar 64 game system, couldd have been far
more successful if Jack were still in the driver's seat.

: One last question: Why doesn't Atari market anything they make?

Lack of money is half of it; the stupidity of Jack's sons is the other.

: Thanks,
: Josh Spatz

My mistake. I reloaded a newer version of NetScape and
changed my defaults. After looking over Peter SinPlops
```

area (advocacy) I realized that these groups were
definietly not moderated. It is a war zone over there.
As far as a life goes, I have raised my 13 year old son
from age 2 1/2 on my own (i'll be 40 this July), restore
and race Vintage Motocross machines (runner up 500cc
Western Regional AHRMA intermediate Champion 2 years
stright), live at the base of the Sierra Nevada's in
the Mojave desert, enjoy stream fishing and camping,
hiking. Currently working on restoring a 1968 Camero.
I am a Tech for the Naval Air Warfare Center, China
lake, Ca. I rebuild missile gyro and optical systems,
build aerothermal models for testing. I have 14 years
experience as a CNC programmer, machine code, APT and
BCL. I am an experienced journeyman machinist.
I own at home a 1040ST 4meg TOS 2.06 and am currently
installing a T-36 just for the heck of it. I picked
up a MEGA ST this year, it's up to 4 megs with a tweedy
and a 500meg HD. I'm thinking of a PAK soon for it.
I'm typing on a 486DX2/32meg ram, ATI Mach 64 4/meg video
in a bitchen black tower and a black cased ACER 15" SVGA
monitor. It's loaded with all the net crap, AutoCad, CadKey
and who know what the hell else. It's got all the shit.
The BEST machine I have (next to my 74 KX450) is my Falcon.
It's in a black Desktopper, 14megs of ST ram, 32 megs of
fast ram on a Mighty Sonic. Inside is a Plextor Quad Plex
CD with 1 meg buffer, 1.08 gig Fujitsu IDE, 540 Quantum LPS
SCSI, Segate Hawk 1.06 gig SCSI , an Expose card and a Key board
Gizzmo. There are NO problems :). It's all tied together
to the pc with a switch box to transfer files with Ghost Link
and use the same keyboard and monitor. Oh yea, theres a 17"
Idek and a Sony multisync on the table as well. Lets see, on
top of the Desk Topper is a Computer-Eyes Video Scan Converter
/ Genlock tied to both computers and I just added an EZ drive
tonight. I have PURCHASED more software than I will EVER use
for the Falcon (ask Jennifer, Alex or STeve)> I've set up at
work a nice little empire as well. Quadra 900 with DiiMo
50 mhz 040/128k cache, 48megs ram, NEC P model 21" monitor,
HPLJ4, and Epson 1200C scanner. A DOS on Mac 486 card and
of course Magic C Mac. GT-Look works quite nicely as does
Papyrus, Works, PageStream, Phoenix, TrueImage, and more.
This is a very fast machine. (for an 040).
More ? Bunch of
8-bit machines (forget how many) Jag with CD and CatBox
(bunch of games). The garage is packed with tools of all
kinds. I've missed a lot.
Looking around I see so much stuff that
it boggles the mind. I need to take a snow boarding trip
this weekend. I need to use up that use or lose vacation
time. My kid will be testing for his Recommended Black
Belt in Feb. I really can't think of anything wrong with

my life except my spelling is screwed, I don't get much
sleep and I have to ocassionally listem to some git
carry on about PC's.

Does the author of STORM still support the program?

2021. New Atari owner

Newsgroup: comp.sys.atari.st
Date: 1996-01-30 00:00:00 UTC
From: tderrick@acpu.com
Message-ID: <9601300000626341@acpu.com>
Source record: 151831

marksh@freenet3.scri.fsu.edu (Mark Scheck) inquired respectfully:

MS> I just inherited a old atari 520st and I have many questions

I only have one. Is it possible for you to change your name? Your initials are the same as a well-known software advertising firm, not particularly admired here. :)

MS> 1) Can the memory be upgraded and if so how high.

4Megs relatively easily, 8M with the Marpet xtra ram board. IIRC.

MS> 2) What's the deal with these monitor resolutions.

Low (320x200x16colors) and Medium (640x200x4colors) are available when using an Atari color monitor SC1224 or SC1435. High res (640x400x2color) monochrome is only available if you are using an SM124, 125, or 147 (commonest models). High res can also be emulated on the color monitor using Sebra. If you have a color monitor, get a copy of Sebra for programs that will only run in High res.

MS> 3) Can you hookup a cdrom, what about a hard drive.

Yup. You'll need a 'host adaptor' such as the LinkII, and SCSI drives. IDE drives won't work.

MS> 5) Can I ftp atari programs to my pc then copy them to a 720k
MS> floppy and use it.

Yes. Format the disk on your pc, 720K, and stuff it into the drive. Unless you have a single-sided drive, which is possible. Format 360K, in that case.

MS> 7) Can someone tell me what is rainbow TOS and what the latest
MS> release was.

Rainbow TOS is TOS 1.4 (1.04). Released in 1989. There are no simple ways to upgrade from Rainbow in your ST, although you can get TOS 2.06 into it for some bucks. Chances are, your machine is TOS 1.0 or 1.2 (1.02). Upgrading to Rainbow is a piece of cake, and should be done unless your only use for the machine is to play some very old (but well-liked) games.

Note that I am posting this publicly, so that Roland and Co. can see it and correct my mistakes. I am aware that some of the absolute statements here are not quite absolute, such as the 'IDE drives won't work' comment. For Mr. Scheck's purposes, they are close enough for government work.

ad910@lafn.org (Bobby Swain) spake thusly:

BS> I can read from the led's that my modem is talking to their
BS> modem at 14,400, but when I DL, I only get about 48%-49%
BS> transfer efficiency. I'm DL'ing using ymodem because my
BS> provider has a bug with Zmodem. Does anyone have any ideas
BS> WHY my transfer rate (character per second) is so slow? Any
BS> ideas HOW I can improve it?

Ummm... what is STalker reporting the cps at? If it is around 1600,
that's about as fast as you can expect. I am using a port speed of
57600 with my 14.4 (4 to 1 compression), and the 'efficiency'
reported by STalker is only 28% for qwk packets - but it is still
cranking along at 1600cps. The efficiency *looks* better if you set
the port speed to 14.4, but the cps doesn't change much.

There *is* a possibility that you are only running at 1300cps, which
I have seen, but never corrected. The problem either healed itself
sometime while I was tweaking the settings, or in one case, the
sysop healed the problem at his end. I *think* 1300cps is about tops
for a 14.4 transferring binaries, but, as always, ICBW.

The Falcon Floppy controller chip also can be set to accept Extended High Density.
I haven't checked it out (but still want to !) but if you put in a 2.88 Mb
Floppy drive it should be able to work fine ...
I think that when the chip is set TOS doesn't recognise it ... you would have to
use Kobold or something that does ...

That's enough of my useless info :-)

As a subscriber (and I think you should sign up NOW for the good of the mag to ensure its longevity) I have become innured to its tardiness. The issue brought forward to be unveilled at the December shows (only 12 days after the previous issue) nearly caused a corronary amongst its readers let alone the AW staff, but since then its been business as normal , Deadlines? who he?

Had it not been that the mag itself was indisputably excellent, some of us would not have struggled on. Maybe someone could send them a callendar accessory for their desktops?

Having lost my credit cards and reported them stollen recently the subscription dept. rang me up on Saturday. They got my new cards details and assured me that my issue had been posted Wed Thur or Fri but of course its now Tuesday eve and the mags in the shops but not on my desk. This won't be the first time I buy an extra copy in the belief that the mailing list has screwed up only to find it arrive in the next post.

Anyone with their eyes open will have got Andrew Wrights private email address from this group recently, maybe a personal reminder to him will have more success than mine (no reply).

Hey-ho. Still Andrew, if you are reading this, Your mag is great but would be nicer still if you went back to STR's policy of 13 issues per year issued once every 28 days. Even then there were screw-ups. Vics editorial which had to be stuck over when the mag changed hands etc.!

The Jan issue's editorial (AW) promised better timekeeping. Have you thought of going into politics? Natural Ability there lad :)

Sorry for the mickey take,

David Greenhough.

That's strange, why would they support 24bit colour, which is only very
rarely used on Ataris and not 256 colour which I imagine is fairly common?

(In case you're wondering, it's not because it comes from unix or anything,
the X versions runs fine on my 256 colour screen)

Remember it's now dead. A machine is not dead when it's still produced aka. C-LAB!

But yes, I agree, we Atari-users are immortal :-)

And actually, the only users I know who has an Atari-computer these days are owning
a Falcon.
All of them upgraded in the last year.

Anyway - the ST is an old 'sprout' now.

Keep Cool and Flying...

VLE> make my 14.4 modem fit in that tiny hole?

It's a standard 9-pin serial connector - the same that's used in most PC's too.
All you need is a standard 9-pin to 25-pin serial cable and you're in business.
:)

Source record: 151605

leslieh@fn1.freenet.edmonton.ab.ca () spake thusly:

L > Gee, I love ESS Code. What version are you using? If you
L > find any problems, let me know and I'll send them along to
L > Michel.

Actually, I didn't say that I was having trouble with it - I just haven't used it enough to be familiar with it. I don't send bug reports or requests for help until 1) the bug is more or less reproducible or 2) I am utterly stonewalled by it, and only a cry for help will do. So far, to the extent that I have used it, EssCode has performed well. You may tell Michel that I said so.
I believe that I owe him for EssCode, btw. But I am not sure whether my license for MasterBrowse covers it. Would you ask about this? The MasterBrowse disk doesn't really answer this question. If EssCode is not included with the MasterBrowse license, you may tell Michel that I *will* pay. I am just behind on my shareware payments. As usual.

2046. Gemulator/Modem Questions

Newsgroup: comp.sys.atari.st
Date: 1996-01-31 00:00:00 UTC
From: awatson@pacifier.com
Message-ID: <4eojre$pav@news.pacifier.com>
Source record: 151606

I just tried using Gemulator 3.02 after using version 4.11. It solved a number of problems I was having with 4.11, but now I can't access my modem properly.

Basically, I can dial out and connect just fine, but once connected all I get is the "CONNECT 19200" message. I can't send or receive anything from the BBS.

I don't have the problem with Gemulator 4.11 or any other DOS/Windows term program...

Does anyone have a suggestion?

Thanks,

Anthony

Same here. Got a mime encoded news item off rec .kites, selected
extract from the menu and saved it as a .txt. Dropped it into esscode
folder untrimmed and got both a JPG and dsc (description) file dumped
to the esscode folder in no time. The mime header read base64 but was
originating from netscape. I had thought base64 was purely MAC format
and therefore undecodable but it worked. Maybe base64 on a MAC is
different and only that form is unsupported on the atari?

>>>>snipped from news rec.kites <<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<

Mime-Version: 1.0

>Posting news is my problem...
>After NNTP KICK, I get the message 501 NEWSGROUP and the message
>480 TRANSFER PERMISSION DENIED.
>My provider doesn't know anything about atari (or don't wants to know)
>I heard several problems on other systems but my PC with netscape 2
>does the job. (and no other program wants to post..)

The problem is twofold. NOS sends an initial (correct) GROUP
<newsgroup> command but then decides to send a blank one. This is an
error on the part of NOS. However, the RFC states that incorrect
syntax should leave the previous command in effect so there is a
problem with your provider's implementation. They are not likely to
fix this just to circumvent a bug in your code.

The good news is, somebody else recently had exactly the same problem
and has fixed it -)

The bad news is, I can't remember what the fix was or the address of
the person. -(

Hopefully, someone else still has this article but if you've had no
response in a couple of days you can try to get it yourself. Email me
if you want to try and do this. It's not difficult to do but it does
mean having to download a lot of unwanted news.

From: hallvart@sn.no
Message-ID: <310eacde4de5ea5@sn.no>
Source record: 151751

Sorry about the loooong delay.... I guess I was the one who started all this stuff about having a Notator/creator mailing list and was willing to try and get something started.

The problem is that I haven't had any luck in finding out how to get an automated list going yet. I've been trying to get in touch with some people who are supposed to know about all of this, but I haven't heard anything from them yet.

So, can anyone here point me in the right direction? Where should I ask, who should I contact? Any newsgroups dedicated to this sort of thing?

I've already been offered by several peopel already to get a manually operated list set up, but I'd like to set it up automatically once and for all so that it won't be affected by the maintainer losing net access, being away etc. And having a single email address from the very start instead of changing it when I get an automated address right away is definitely an advantage.

2066. Can the Atari SC1435 be at TV?

Newsgroup: comp.sys.atari.st
Date: 1996-01-31 00:00:00 UTC
From: plouie@isc.sjsu.edu
Message-ID: <4emgcb$nt8@nuke.csu.net>
Source record: 151756

Is it possible to input a TV (I guess it's composite) signal into the Atari SC1435 monitor through the RGB port so that one can use it as a TV?
I know the monitor is really a Magnavox RGB monitor in disguise, but the composite input plug has been removed.
Is there any modification that can be done to the monitor to put in a composite video plug?

I've seen an Amiga (yeesh) owner do this with his Commie monitor and thought it was kind of neat. I would like to only have 2 monitors instead of 3 in my very crammed dorm room.

Thanks, Phil

Ever tried dailing into any Atari BBS in Singapore?

>Any one knows whether there are any ATARI 520STE internet sites where I
>can d/l some software to use?

Atari goodies can be found at :
Hensa UK Atari WWW = http://micros.hensa.ac.uk/micros/atari.html
Atari web pages = http://www.mcc.ac.uk/~dlms/links.html

Hensa have a time restriction - you can only access when it's night time in UK, which is day time here in Singapore. The Atari web pages will give you links to all other Atari related links including ftp sites. Have fun.

Regards
William

Message-ID: <DM1D4n.7zr@ridgecrest.ca.us>
Source record: 151772

Hi Raymond,

Thought you may find this interesting.
I found a DOS program called VFD17.zip
on a French graphics web page. It is only
DOS, so you don't have to look at Windows :).
What it does is take an FLC or FLI and builds
an AVI file from it. It will also extract various
pics from FLI, FLC and AVI's (kind of redundant
on the Falcon, however). There are many options
that can be entered in the command line such as
color depth (unregistered limited to 8-bit, but
will process 16 and 24 bit AVI's) playback speed
compression, Indeo pallett type and dithering.
It does a very good job. Once you have an AVI
an MPEG is only another program away. It beats
having to string two or three hundred GIF's or
TGA's together for an MPEG, if you happen to have
a dos box laying around. I use to have Falcon Speed
installed. It would run dos programs easily and fairly
quick. That would be another option. The owner
writes that it is possible to <purchase> his
code for inclusion into other programs. Ummmm...
Time to take a look at the ole Hi Soft manuals....
If you or anyone else would like more info,
just mail me :).

One other note. My 486 dosen't even come close to
the Falcon in play back speed using the Windows
AVI player once the file is converted. Deter's
AVI 68881 player is faster on my Falcon.
Falcon 32mhzCPU/FPU w/fast ram. 486DX2/66
VLB Graphics Turbo Pro 4meg video card.
THIS WAS NOT DUE TO FRAME RATE SETTINGS
for those of you that will try and argue the
fact. This compairson is between these two
machines only, not your dad's Pentium.

Mike

Alan Page stopped supporting STORM about 5 minutes after the patches for version 1.02 were released. Sad, because IMHO it is without a doubt the most flexible comm package I have used on any platform!

2085. bincancel:4 large binaries:AR103:@@NCM

Newsgroup: comp.sys.atari.st
Date: 1996-01-31 00:00:00 UTC
From: red@redpoll.mrfs.oh.us
Message-ID: <ARMM-Report-103@redpoll.mrfs.oh.us>
Source record: 151775
Cross-posted to: alt.retromod,alt.nocem.misc,news.admin.net-abuse.announce,news.admin.net-abuse.misc,misc.invest,comp.sys.ibm.pc.games.sports,comp.sys.atari.st.tech,comp.sys.atari.st,comp.os.ms-windows.nt.setup.hardware

-----BEGIN PGP SIGNED MESSAGE-----

I have issued 4 cancels for large binary files (average size 162,851 characters - total size 651,407 characters) posted to 5 different unmoderated discussion groups in the comp and misc hierarchies as follows:
1 misc.invest
1 comp.sys.ibm.pc.games.sports
1 comp.sys.atari.st.tech
1 comp.sys.atari.st
1 comp.os.ms-windows.nt.setup.hardware

This report is being cross-posted to each affected newsgroup.

The criteria used to search for this batch of large binaries were:
SIZE: > 120,000 characters
NEWSGROUPS: Unmoderated akr, biz, comp, misc, news, rec, or sci
BINARY: (.zip, .jpg, .avi, .exe, .sit, .bmp, .bin, .wav, .gif, .dwg, .fon, uuencoded and base64 encoded files, etc.)

The contents of the files are not relevant to these criteria for classifying an article as a "large binary". This is something that can be done by a simple program.

The cancels follow the "<cancel.", "cyberspam!", "bincancel!", and "X-Canceled-By: " conventions. News administrators may block these cancel messages specifically by aliasing out "bincancel" or generally by aliasing out "cyberspam".

In my opinion, the best way to distribute binary files is via ftp or the web. With the ready availablity of ftpmail servers, even uucp sites can retrieve binaries from ftp sites.

However, if you really must post a binary to Usenet, please post it to an appropriate binaries newsgroup such as alt.binaries.misc. Then, if you like, post something in the appropriate discussion group telling people where to find the binary in the binaries group (a "pointer" to the binary). This will permit news administrators and users to decide for themselves whether to receive the binary files.

There has been a long-standing consensus among news administrators that binaries belong in binaries newsgroups, and not elsewhere. There also seems to be an emerging consensus supporting the cancellation of large binaries in discussion groups as long as appropriate protocols are followed. I am testing that consensus and developing a protocol.

Please direct public feedback to news.admin.net-abuse.misc and private
feedback to myself at red@redpoll.mrfs.oh.us. If there is an
unmoderated binaries group in the hierarchies that I scan, I don't know
about it yet. Feel free to enlighten me.

The sizes and headers of the canceled binaries follow:

POP mail is where mail is delivered not to your computer but to a mail server
that allows it to be read by a special client.

I don't think you can use it on demon (because of the way demon users are
given separate hostnames) but I could be wrong.

> Umm.... The TT030 I got has this enviroment called
> TOS and GEM... How do I use it? Can I get something better?

Well, in an Atari, TOS is the operating system, and GEM is the Graphical Environment Manager (the bit that deals with the windows and menus and so on). Using it is pretty straightforward - if you've used a Mac or Windows, you'll figure it out easy enough. Something better?? Well, there are replacements such as Magic (which are Multitasking, and generally better all round), but you use them in very much the same way.

> Also, should I have the option of choosing TT high resolution?
> If so... it is not giving me that.

I *THINK* that you need a special kind of monitor to do TT-High. I'm really not sure as I don't have a TT (you lucky, lucky thing!!).

> Does this mean it is broken?

Probably not :)

> Needless to say, I am lost... Where on earth is the shell?

There's no shell with the Atari - you do everything in the windows environment. You can't quit to a DOS-like prompt. If you're *DESPERATE* for a command line, I think you can run a program to give you one. It's public domain (I think), so search around for something along the lines of COMMAND.TOS. (I think that was the name... It was such a long time ago I used it!!!)

> Anotherthing... My system has a modem1,modem2,serial1,serial2
> port... that is 4 serials I counted. What gives?

I think Atari intended the TT to be used as a workstation, but perhaps they went OTT with the serial ports!! Not a problem, though, you'll probably only need the one of them.

> Also, What is this "Warp9" accelerator.. like what CPU and speed?

Warp9 is a 'software accellerator' - It replaces a few of the slow operating system routines with much faster ones, therefore making the machine run quicker. Clever, eh?? Actually, Warp9 is pretty old now - If you can, go for something called NVDI instead - it's faster, more fully-featured, and a lot more compatible.

> Sorry for dumb questions... but this is first time
> I even turned on an Atari system and being used to NeXT, SVR4,

> and other UNIXes... this is really confusing here...:-(

Don't worry about it! Brew yourself up a nice cup of tea, sit down in
front of the computer and spend an hour or two just playing around seeing
what you can find. You can't do much damage (just don't try and delete
anything that looks like it could be important!)...

Cheers,

Neil.

I have a few questions about Mint and MinixFS, and wondered if anyone could help me.

I am preparing to install Mint on my system for a bit of fun, but before I do it, I basically want to be reassured it won't trash my hard drive.

I have an ICD formatted 520meg drive, with 1 small boot partition (GEM) and 2 250meg partitions (BGM). I plan to empty one of my large TOS partitions, and allocate that as a MinixFS partition.

Basically, I want to know if a 250meg ICD partition can be turned into a MinixFS one, and whether or not I can do that without reformatting the whole drive. Also, is this easily reversible?

I plan to use the Distrib_kit held at atari.archive, but the more I look at it the more dated it looks. Old version of MinixFS, old version of Mint etc. etc.

Can anyone make a list of useful updates to the Kit?

Well, I'll stop now, I've asked enough questions for a hundred people.

John

My thoughts exactly, I'm not an electronics expert but I shouldn't think it would take much to
turn all those accelerators into full machines. I understand the PAK68/3 can take memory and
graphics cards already... how about keyboard, serial, parallel, mouse/joysticks, DSP, SCSI 2,
etc and what do you get ... a FALCON!

Any details on WizzTronics Falcon-close.

Andy.

Source record: 151788

I got a problem with my Falcon.
Whenever I switch on all I get on the screen
is an unsyncronised image of some black and white boxes.
The rest of the system seems to run properly.
(i.e key-click, abort memory test with ESC, hard disc running, ...)

I wonder wether this realy is a hardware problem and if there
is a way to find out what exactly went wrong.

```
: Not necessarily. Doom ran just fine on a 486/33. If the DSP
: really gave graphical enhancement comparable to the brute force
: of a pentium, there would be no doubt whatsoever that a Falcon
: Doom clone was possible.

The DSP itself is great for mathematical calculations because of the way
it can handle commands in parallel and it's operations are fast. With
optimized code it can beat a hispeed 486 processor (>66), but then you bump
into the problems with the bus again.. which is the main reason you haven't
seen things working faster than they have. A Doom clone would be done in
TC mode anyway (because of chunky pixel) and for that reason the bus would
be even more overloaded.
Even so.. better results should be possible than what bad mood as showed
us so far.

: If I need one, I'll buy one. But I won't need one, because
: there's a CD ROM built-in - another thing which would push the
: Falcon's price up even higher.

Er.. CD ROM is hardly the only purpose of having a SCSI-2 interface...

2104. CAB not loading data (received 0/0)

Newsgroup: comp.sys.atari.st
Date: 1996-01-31 00:00:00 UTC
From: John Maxwell Hobbs <jmax@interport.net>
Message-ID: <310FC194.2805@interport.net>
Source record: 151794
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've just developed a problem with CAB. This started when I downloaded the latest version, but may have nothing to do with that.

None of the versions of CAB I have on will download data after STiK connects with the host. My modem indicates incoming data, in spurts, and tells me that my computer is sending a short burst of data after each spurt, but nothing come through. STiK seems to have no problem resolving hosts. The same situation seems to be true of the IRC program, but I've never really used IRC, so I don't know if I'm doing something wrong there. I can connect to an IRC server, but when I do something like "/list" nothing happens, although I see activity on my modem.

I'm using a Mega STe with 2.5 megs of memory and a 14,4 Motorola FasTalk modem connected to modem port 2. This configuration worked quite well until recently.

Thank for any help

>
>... I finally got it together, and I forgot where I put it!
>___ Mountain Reader II - #00000077
>

I didn't know efficiency could vary within a given connect speed!
Curiosity prompts me to ask how is efficiency calculated...for that
matter, How does CPS relate to connect speed?

Anyway, I just conducted a test.

One packet came in at a blazing ~1000 cps (~70% efficiency).
Most, however, were in the "normal" (for me) range of 700-800 cps.
One came in at about 315 cps.

On another tack, you mentioned, in advice to a new user, that the
ST could be configured with up to 8 meg RAM by way of a board. For
sure? I've got a Mega ST 2+2 that I'd love to bump up to 8 megs.
Where is this thing and how many pints of blood is it going to
cost me?

Thanks for taking the time to reply,

Bob

2114. Question about ST

Newsgroup: comp.sys.atari.st

Source record: 151554

OSP <yfcprod@mhv.net> spake thusly:

Y > Hello, My friend just got a secondhand (obviously) Atari
Y > 1040ST. I know nothing about Atari (I have two macs and my
Y > partner uses PC's) Basically, what I want to know is how does
Y > this computer relate to either PC or Mac,

Well, it isn't much like either of them. It uses a Motorola 68000, like a Mac (an old Mac, it is true, but it is the same series that Apple used exclusively until the advent of the Power PC). It was known as the 'Jackintosh', for Jack Tramiel, when it was introduced. But it uses its own Operating System, so there is no Mac or DOS program compatibility.

Y > and what is the file compatibility.

You can format a disk as MSDOS 720K on your Mac, and the ST will read and write to it. ASCII files will go back and forth with no problem. Converters are available for Atari native word processing formats to MS Word and Word Perfect (RTF). As far as graphics go, we in Atariland have our own variety of file format chaos, but there are programs that will deal with BMP, GIF, Mac, JPEG, and others that you may be familiar with. WAV and MIDI files can be dealt with, and there are Lotus-compatible spreadsheets, as well as database programs that use more-or-less standard formats.

Tell your friend that he has a *real* computer, not a toy. Tell him "The Poor Deluded Soul" said so, and I welcome him to the ranks of the computer heretics. And let him know that he has the *best*, bar none, beginner's machine that ever was. If his target is computer literacy, he has the right tool for the job.

What a coincidence! Cycling between the terminal screen and the capture buffer window is part of the weirdness. I thought I had a defective mouse switch! It may occur with ANY screen saver because I'm pretty sure I've experienced it without Warp 9 installed.

The other problem I've had is errors writing to the hard disk during Zmodem downloads. I've overomce that one by leaving out the MODEM.CPX file. I have no idea how or why it caused this problem, but leaving out MODEM.CPX has solved it!

i use warp 9 with flash 1.6 and have no problems (screen saver is on).
what options did you
turn on in warp 9? and, just to let you know, i have the modem cpx
installed and i couldnt get my modem to work at higher than 2400 without
it (though, i found out later it might have been something else, loose
hardware)

>either PC or Mac, and what is the file compatibility. Any other info
>about the computer would also be appreciated. (My friend is
>completely computer illiterate, and using Macs for so long, so am I

Well, lets see... as a Mac user yourself you should have no trouble familiarising yourself with the ST, the "Finder" is what appears first, from here if you click on the drive icons, just like the mac, it will open a window with the contents of that particular drive. Depending on the OS revision ("System x.x") folders and files can also be placed on the desktop. So much like a mac, its uncanny...

Also the disks (again, depending largely on The OS revision 1.62 or above, preferably 2.06 is preferential) are somewhat compatible with PC 720k floppies, data can be exchanged no problem, HOWEVER neither Mac or PC programs are compatible, luckily there is a wealth of shareware out there to give him the basics at no/little cost, telecoms, word processors, games, etc...

Hopefully people can add more guidence than I to this thread :)

2123. Stalker DL problem

Newsgroup: comp.sys.atari.st
Date: 1996-02-01 00:00:00 UTC

ad910@lafn.org (Bobby Swain) spake thusly:

BS> I didn't know efficiency could vary within a given connect
BS> speed! Curiosity prompts me to ask how is efficiency
BS> calculated...for that matter, How does CPS relate to connect
BS> speed?

Well, now you are asking me for more than I actually know. But I think of it this way: cps is what you and me are after. The faster the better. STalker is the first terminal program that I used that calculated 'efficiency'; I believe that it is calculating actual cps divided by 'theoretical max cps' based on the speed of the connection between the modem and the computer, *not* between the remote computer and your modem. On my setup, STalker reports '57600' on connect, and the BBS reports 'connected at 14400'.

BS> One packet came in at a blazing ~1000 cps (~70% efficiency).
BS> Most, however, were in the "normal" (for me) range of 700-800
BS> cps. One came in at about 315 cps.

Well, that is certainly not max speed for a setup similar to mine. However, this one here is a TT with the goosed-up Serial 2 port. If you don't have this, you are limited to 19200 port speed, although I have been hearing something about a serial port hardware hack that does something that should help. Another thing that comes to mind is HSModa6.

When I had an ST hooked up to this 14.4 modem, it seems to me that I could get ~1600cps transfer speeds, as reported by the BBS, but I don't know for sure. It is possible that I was happy with ~1300cps. I'm pretty sure I was getting ~1300cps or more. But that was before I was using Stalker.

It sounds to me like you have some settings to tweak, but somebody else will have to answer - I have run out of good help on this.

BTW, be sure to run the BackTalk script for resetting the modem port when you quit, if you plan to use Bob's Calltime or STraight Fax.

BS> On another tack, you mentioned, in advice to a new user, that
BS> the ST could be configured with up to 8 meg RAM by way of a

BS> is it going to cost me?

Toad's 95 catalog lists (page 36) 'XTRA RAM 8MB' for $129. At this price, its gotta be unpopulated. I saw a little article about a year

ago in ST Format about this, which confirmed the existence of this possibility. That's all I know. Check with Toad for further info.

>only needed for tos 1.4 or older, and I might be wrong on 1.4! I know for
>a fact that ledpanel causes problems in certain circumstances, but don't
>know if it is contributing to the specific one you have or not!

Hmmm... I don't think what you say about Jar10 is correct. As I've
been running out of cookies I've has to install jar10 (or a similar
program) so that space for more cookies would be assigned. Running
Jar10 helped, but with a little erratic behaviour (sometimes it would
let me have extra cookies, sometimes not).

another cookie program worked better though, but somehow Jar10 seems
to work OK now (probably has something to do with the order of teh
Auto programs).

Ledpanel might be the problem, but I don't think so as I've tried
running with/without it.
The most probable cause now seems to be Peter Missel's explanation
about the AES bug. If I could only find that "Ovfix1.prg".....

Depends on your definition of "better". :-) There are other operating
systems for the TT: NetBSD, Linux and Atari SysV.

> > Also, should I have the option of choosing TT high resolution?
> > If so... it is not giving me that.
>
> I *THINK* that you need a special kind of monitor to do TT-High. I'm
> really not sure as I don't have a TT (you lucky, lucky thing!!).

Right, an ECL monitor is required for TT highres. For example Atari's
TTM19[45] (ECL only) or an EIZO 6500-M (ECL/VGA).

> > Anotherthing... My system has a modem1,modem2,serial1,serial2
> > port... that is 4 serials I counted. What gives?

Modem1 is the ST compatible serial port, limited to 19200 bps.
Serial1 is the port without control lines (also limited to
19200 bps), which could be used to connect a serial mouse.
Modem2 and serial2 are the real serial ports. Modem2 is
limited to 153600 bps, serial2 to 230000 bps. Use modem2
to connect a 76K8/153K6 device, serial2 for 57K6/115K2.

> > Sorry for dumb questions... but this is first time
> > I even turned on an Atari system and being used to NeXT, SVR4,
> > and other UNIXes... this is really confusing here...:-(

I think, you'll want to run NetBSD or Linux on your TT. ;-)

For info on NetBSD/Atari join the mailing list:
$ echo "subscribe port-atari" | mail majordomo@netbsd.org

For info on Linux subscribe to comp.os.linux.m68k .

Hi according to the STalker manual;

Efficiency rates the speed of your data transfer where 100 percent
is the theoretical maximum speed (baud rate/10).

I have modified my STFM so the serial port can run at 38400 baud, so
I can use a 28k8 modem at 28k8. This give on the download typically
3000 cps and efficiency of 28730 percent!! I use HSMODEM6 with this
modification.

Other factors are the settings for error correction/data compression
on the modem.

Its been on 42BBS for some days now but didnt appear on the Hensa
falcon news dated 22nd Jan (maybe in TOS section which hasnt sent a
news recently AFAIK.

However, even tho' we can get every thing the mags can Maybe it'd be
wothwhile subscribing "with disks" to AW? It's there ;- v4e whereas my
copy from 42 was in german I think.(It's now 4e there as well now)

Some of their disks have been A1 IMHO and well worth the extra !

Cheers..........David G.

IIRC, the program "DISPLAY" does all that, too, and much more.
Running under DOS (& Windows, at least here it does).
To be found at any Simtel-mirror-site.
Check it out !

KL> showed us so far.

So why doesn't you join the team then? We would love to see Bad Mood faster than it already is. It's the fastest Doom clone on the falcon so far with a _long_ shot. Even most Wolfenstein (I can't actually remember one) clones can't compete with it.

I have seen your demo (the 128kb one) and it do look good, so your help could be valuable.

Apparently here is a bug in Oasis and/or NOS where the .NWK file
contains an extra line that NOS sends after the original GROUP:
message is sent, the server then gets confused and can't recieve :-(
Demon's servers over here are more tollerant and if you need to send
messages urgently then send email to:
[newsgroup]@mail2news.demon.co.uk .

Yep, I downloaded my copy a few weeks before AW put it on their disk
after several tries but all seems ok now: ftp.uni-paderborn.de sorry
that I can't remember the path but I think it's somewhere in the
atari/tools bit under the name ude4etos.tos.

>possible. But it's faded from my memory unfortunately. If I remember
>correctly it had to do with RLL drives and crappy MFM drive controllers.

It works like this: an MFM harddisk and an RLL one differ only in the quality
of the magnetic surface. An MFM harddisk has 17 sectors per track. When better
materials became available, manufacturers squeezed in 26 sectors per track on
the same type of harddisk, thus inventing RLL. An MFM-controller will use both
types of harddisk fine, albeit it can use only 2/3 of the capacity of an RLL
disk. Vice versa, an RLL-controller will use 3/2 of an MFM-drive, if used.
So, an 20 MB MFM drive will format as 30 MB. But, of course, there is a catch:

Because the magnetic properties of an MFM drive are not up to par for
this extended format, data will become corrupted very easily and you may get
many bad sectors very early. This depends on the quality of the manufacturer
of the disk also, of course. Some drives are just better than others.

You could compare it to formatting a standard 3,5" floppydisk with 11 sectors
per track, 83 tracks. Some disks will work fine, others won't.

In any case, it's pushing the envelope. I myself couldn't live with a
harddisk that's not 99,998 % reliable at all times.
But everyone has to make that decicion for themselves...

FWIH it's a combination of both. Some mailers don't fill the Lines:
line correctly or people edit the posting after this has been set,
Oasis reads this line and does not exceed it and so Oasis only reads
the number of lines that it is told are there.

M > window is part of the weirdness. I thought I had a defective
M > mouse switch! It may occur with ANY screen saver because I'm
M > pretty sure I've experienced it without Warp 9 installed.

Could be. I am told that there is a virtual screen behind the screen you see on the ST. If two programs (screen saver, STorm) try to use it, the results might be pretty much as we described them.

Does STorm have a built-in screen saver? I know that Marcel does - seems like there was a short era of that.

Attention gurus: please correct misstatements, idiocies, and inconsistencies in my words above. I would like to know more about this 'second screen' and associated phenomena.

M > The other problem I've had is errors writing to the hard disk
M > during Zmodem downloads. I've overomce that one by leaving
M > out the MODEM.CPX file. I have no idea how or why it caused
M > this problem, but leaving out MODEM.CPX has solved it!

I was told sometime back that STorm had a bug in its ZModem handling. Supposedly Alan Page and some volunteers were going to squash it, but I never heard any more about it. If version 1.02 is still the latest, nothing has been done, as that version has been available since early 94 IIRC. If removing modem.cpx is all that needs to be done to fix it, that is valuable data. At least for those of you who are not married to Warp9, as I am.

However, I have been drooling over NVDI for a while. Time for a divorce?

MiNT is pretty safe, don't worry.

> Basically, I want to know if a 250meg ICD partition can be turned
>into a MinixFS one, and whether or not I can do that without reformatting
>the whole drive. Also, is this easily reversible?

Yes. You just empty one partition, run a program called `minit' and
hey presto, a minixFX partition. Of course, you _will_ lose everyting
on the partition, but you knew that. You can simple reverse this with
`minit -r'. After that, you will have a normal blank TOS partition
again.

> I plan to use the Distrib_kit held at atari.archive, but the more I
>look at it the more dated it looks. Old version of MinixFS, old version of

If you can read German, the KGMD (Knarf's German MiNT Distribution) is
very complete and up-to-date. I forgot the exact site, but I think
it's on an ftp site in Mainz (among others, but this one is reasonably
fast).

2154. FS: Atari 1040ST System

Newsgroup: comp.sys.atari.st
Date: 1996-02-01 00:00:00 UTC
From: meye8732@harrier.csrv.uidaho.edu
Message-ID: <4eq08d$756@newshound.csrv.uidaho.edu>
Source record: 151626

I would like to sell my Atari ST computer system.

I have a 1040ST, Supra 105 meg HD, SC1224 color monitor, 1200 baud modem, TOS Extension Card (uninstalled), and a Panasonic KX-P1124 printer.

Software includes DegasElite, 1stWord Plus, DBMan, GFA Basic, Neodesk 3.0 w/ CLI, DungeonMaster & Dungeonmaster 2, plus dozens of other titles.

I am asking $850 plus %50 for shipping. Payment by COD, money order or cashier's check only. If interested, or for more info, email me at:

meye8732@uidaho.edu

>list? Can you help me please!

It was sent correctly, and was auto-cancelled by a program that cancelled
all binary postings in discussion groups. If you want to post it so it
doesn't get killed, put it comp.binaries.atari.st. Alternatively, most people
on this group have ftp access so it might be easier just to upload it to
an ftp site.

Source record: 151630

Hello!

What do I need to make my ST dial my Internet-provider once or twice a day, grabbing some news and new mails, and sending some mail I've written? Is there a proggy that would do all this with a nice and beautiful GEM interface -- one that would work without MiNT..?

Date: 1996-02-01 00:00:00 UTC
From: pl4266@cc.utah.edu
Message-ID: <4eq7e7$4i9@news.cc.utah.edu>
Source record: 151631

I NEED to mount a Syquest 270 Atari format disk on a MAC. So I
can read the AIFF files made by Cubase Audio Falcon onto a MAC disk to
put them onto a CD-R and this is a run on sentence and the sun set and
the sun rose and it was another day and someone flamed me and they also
sent me some MAC mounting software to put my Atari syquest 270 onto a MAC
and I already mention that didn't I ?

And you responded by E-mail directly to me and I thanked you.

Paul.Luscher@m.cc.utah.edu

>a single one, even with the new CPX's installed again.

Well, I doubt it's Xcontrol in my case as I had the problems long
before I got hold of my hard disk (no use to install Xcontrol with a
disk drive)..
And I've tried Zcontrol- didn't like it!
It might just be the AES bug Peter Missel wrote about, but I'd like to
know what it's all about and where I can get the "ovfix" program.

Well, I believe that there are speedo drivers to do this. In France you can find them easily on ftp.cnam.fr in pub/Atari/
There are also drivers for stylus color, canon bj color, with dithering or color separation, etc. The docs are in french, but using them is very obvious, as there are programs to install them automagically.

I believe that you asked me mpeg audio decoder, isn't it? do you got it?

:
Go back to 4.11. I never got my modem to work right at all with the
Gemulator 3.02 (DOS). To work best, set your terminal program for 110
baud, and set 'Fast Baud Rates'. That way you are talkign to your 28,800
modem at 115,200. There is a chart of other connections, If you only
have a 14,400, then you'll going to have to set the Atari's term program
for another value, which I forget, since I don't have a 14,400, and never
bothered to remember, I just leave it at 110 (strange mapping, but that's
the way Darek did it for reasons known to him).

Yes it did exist. So did GEM for the PC. Not long ago a member of my
user group (National Capital Atari Users Group) had some new GEM packages
for sale. I don't know if he still has them. Yes, FirstWord did run
under GEM.

>No need to sound so snotty young spud...
Snotty, where's it snotty? - jeez, I dunno, youngsters today are so
sensitive.
BTW I'm 40!!

We're at cross purposes. Yes, what you say is valid and fair enough but the
point I made to the original enquirer was that with a *straight* version of
v5.52 you can't program MiNT programs (and for the Falcon) just as you can't
program for MagiC specifically or X-Windows or Amiga. You need external
libraries. Yes, you can FTP MiNT-libs instead of using HiSoft's if you want
but that wasn't relevant to the question originally asked which was 'what was
the diff between v5.52 and v5.60'.

Look, OK you can have 50 Pedant Points this time, but I won't be so generous
next time!

>(who wrote DUftp & XaAES for MiNT with 5.52, so I should know)
Oh dear, well if we're trading credential lists, I think you'll find mine is
longer than yours. :-P
Now THAT'S snotty ;-)

I think the DOCS have some info about ICD partitions, sometimes they are
not AHDI compatible & this may cause problems. The DOCS are included with
the source files for MinixFs, they are worth reading.

>
> I plan to use the Distrib_kit held at atari.archive, but the more I

I installed this several years ago, & it worked; but the partition was
only 32Meg. Sometimes Minit has problems with getting the partition size &
I once had to manuall set these for a large partition.

Knarf's German MiNT Distribution is better - very new - (mid 1995).
It can be found at ftp.phil.uni-sb.de/pub/atari/mint/KGMD-1.0/

Try ftp.demon.co.uk \pub\atari\new (I think). You're looking for oasis135.tos
It's also on hensa.micros.ac.uk (I think). Basically it's a shell which
will help you configure NOS (included) to work with, in your case, pipex.

You'll find the authors of the software really helpful if you get stuck.

BTW If you want to hang on a bit oasis 2 is just about to enter beta
testing (AFAIK)

Best wishes

Neil

2177. Re: Atari syquest-disc on Macintosh

Newsgroup: comp.sys.atari.st
Date: 1996-02-01 00:00:00 UTC
From: Tom Lamparty <lamparty@telerama.lm.com>
Message-ID: <Pine.BSD.3.91.960201130003.15471A-100000@india.lm.com>
Source record: 151649

If Your Syquest is an external unit (from the manufacturer) then
all you have to do is drag it over to the mac and plug it in! Of course
you will need to find and install a driver for it on the mac! If like
mine it was a bare drive and has been built into a third party case, then
you most probably have some sort of host apadter in that case also. In
this case you will need to remove (unplug) the host adapter from the
scsii chain and maybe fiddle with the terminator packs on the drive,
depending on where it falls in the new scsi chain on the mac (if it is
the last physical drive on the chain it needs termination, if it's in the
middle then it must not be terminated!
One thing you failed to mention is if this drive has 1 or more
scsi ports on the back of it! For a Syquest 44M these should be 50 pin
scsi ports and look like something that belongs on a printer! if all you
have are dma in and out (19 pin) then you may have to do what I did and
add your own scsi 50 pin centronics ports, this takes a little hacking of
the case, and some hunting through catalogs to come up with the correct
connectors but isn't that difficult! Two scsi ports is best, or that
drive has to be at the end of the chain.

Theoretically it should be possible, but you need an additional TV-tuner.
The antenna-signal is not the same as a so-called composite-signal.
The most convenient TV-tuner would be a VCR, for example.

Help!

I have noticed that if I have secveral news items to post, the first connect won't post them all (using Oasis 1.35e). I often have to kick nntp several times, and it seems to post a couple at a time <grumble>. So I have to kick, check, kick,check until they are all gone <grumble>.

Could this be a setup problem?

Thanx for any info...

From: Timothy Miller <millert@csee.usf.edu>
Message-ID: <Pine.SUN.3.91.960202105444.23584B-100000@grad>
Source record: 151507
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I hope you don't mind me posting also to the newsgroup, but when I organize my source code, I will simply stick a ZIP file on my web page and let anyone download it, so others may be interested in this.

On Fri, 2 Feb 1996, Rod McCall wrote:

> In article <Pine.SUN.3.91.960202014449.16521C-100000@grad> you wrote:
>
> : Source code to much of the software I have developed will be collected

> I may be interested in some of this, what were you in the middle
> of developing?

A terminal program that's faster than anything else for the Atari. It's not in working order, because I'd come up with a way to speed it up further. If you're interested in developing it, I'll give you the source. You study it, and then get back to me to find out what I was doing to it. Also, the VT102 emulation is flawless, with the exception that it won't ignore an '=' sign after the '[' in an escape sequence.

A BBS program. There isn't much to say, except that it requires MiNT, it's multi-node, it has a concentrator to connect the BBS software (redirected to pipes) to the serial channels (not necessarily modems) AND to a terminal display handler (a DA), which you can use to control the concentrator (a background process). There are some plans I had that I never even began to implement, because I could not get the concentrator to read from the serial port without echoing. The display handler has code ripped from an older version of the above terminal program, so it's much slower, but still faster than programs like ConNect. Get back with me to find out exactly what I did to make it faster. Also, it has its own fonts and a display routine written in assembly used to image a line of characters to be blitted on the screen which may be of interest to some.

An a-modal dialog handler and application framework. It lets you do almost object-oriented GEM programming in Lattice C. It doesn't do as much as most of the others, but it's small, and it has some unique features. It's not documented at all, but you can sift through other programs that use it, and discuss it with me in email.

Some various aborted graphics and audio projects.

A text editor that was on its way to being fairly nice. It was intended to be rewritten to fit into the above terminal program. It's a bit buggy here and there.

An over-the-modem drawing program. One of the key source files was wiped, and I never got around to rewriting it. It lets two people connect with modems and draw pictures with each other. This can be more useful than it sounds.

A library of small code segments that I have found to be useful over the years.

And I wrote a program to demonstrate Pie menus.

There are a few other tiny little things.

I likely will not release this until my Falcon is sold. And there's much of it that I'm going to port. I just thought that once I'm gone someone else can go in the direction I was heading.

No. I'm going to disable the other screen saver and see if the
screen flipping goes away. I let my son use my Golden Image mouse because
I thought it was causing the problem. Now maybe I can reclaim it!

SY> I think that when the chip is set TOS doesn't recognise it ...
SY> you would have to
SY> use Kobold or something that does ...

I haven't tested it because these drives (and the disks) are very expensive and very rare...
However, I believe that you can use a 2.88MB drive without any problems. It's not only the controller chip that can be set to ED -there is also a solder-pad-jumper on the PCB that sets this, so my guess is that even the TOS may be ready for accepting ED-drives...

dm> I wonder wether this realy is a hardware problem and if there
dm> is a way to find out what exactly went wrong.

I believe that the most probable cause is a broken video chip.
When you start the computer, there aren't any programs that can mess things up,
since you haven't loaded anything at the time.
One other possibility could be if you've tried to mess around with the NVRAM -
other people have killed their Falcons because of such things. If it's in the
NVRAM, I believe there is a way of esetting it, but I can't remember right now
- anyone else?

Yea, I have a 1084 and it works nice as a dual monitor. The SC
1435 I have at work will not accept composite input. If you are
using a Falcon and have been thinking of Expose, the splitter
that comes with it will drive an RGB monitor. I ran S-VHS to the
splitter and used my SC1224 as a TV. Nice output. You will have
to make your own cable, but Titan will supply you with the Pin-
outs needed.

The last thing I can think of concerns some USR modems but I don't
know the details of this. It is possible that a few USR modems have
buggy ROM chips (oo-er!).

True, it can be done with 3rd party adapter cards. My point is, you should
be able to do a reasonable memory upgrade _without_ having to plug in the
additional cards (beyond the SIMMS themselves, that is.) On my PC at
work, I went from 4 to 16 meg by replacing 4-1meg SIMMS with 4-4meg
SIMMS. I did the same when I upgraded my STe from 1 to 4 meg.

"looking for internet software"

I guess you mean for the ST/Falcon? As the only part of your posting I got was the path and subject details!

Anyway, I'm no expert, but I use Oasis v1.35E which sits on top of NOS v0.42. It works anyway, but should be superceded shortly by Oasis 2 and ICE (an alternative to NOS).

I'm sure that there are lots of people in this group that can add more to this, and tell you where to get Oasis/NOS from.

Hi people,

I have a brand new Atari Jaguar (bought December 95); with an extra
controller (boxed), and 'Dragon' - The Bruce Lee Story (boxed).

All of the above system is boxed too. It does have the UK jaguar
hollograms on the opening edges of the box.

It was an unwanted Christmas present - it is still in mint cond.

How does 60 Ukpounds sound??? Including Postage??? (UK only)

Any offers..e-mail me at the below address.

Cheers.

:
: > I am preparing to install Mint on my system for a bit of fun, but
: >before I do it, I basically want to be reassured it won't trash my hard
: >drive.
:
: MiNT is pretty safe, don't worry.

Yeah, I'm sure it is.... I'm only doing this for a bit of interest, as I know (and have now experienced) how slow Mint is on a 2MB unaccelerated STE.

: > Basically, I want to know if a 250meg ICD partition can be turned
: >into a MinixFS one, and whether or not I can do that without reformatting
: >the whole drive. Also, is this easily reversible?
:
: Yes. You just empty one partition, run a program called `minit' and
: hey presto, a minixFX partition. Of course, you _will_ lose everyting
: on the partition, but you knew that. You can simple reverse this with
: `minit -r'. After that, you will have a normal blank TOS partition
: again.

Thanks, I did that, and I got a minix partition. Is there any way I can increase the number of characters it has as max for a filename. I used version 0.61 of Minix, and it gave me something like 10 or 12 characters only. :(

: > I plan to use the Distrib_kit held at atari.archive, but the more I
: >look at it the more dated it looks. Old version of MinixFS, old version of
: >Mint etc. etc.
:
: If you can read German, the KGMD (Knarf's German MiNT Distribution) is
: very complete and up-to-date. I forgot the exact site, but I think
: it's on an ftp site in Mainz (among others, but this one is reasonably
: fast).

Hmm, I can't read German, but I might still I have a look at it. After using the other Distrib Kit I am even more unimpressed. The setup program crashed with Tos Error 22 (good error catching eh?) and the install program refused to work also.

I ended up just manually unzooing all the archives onto my minix partition.

I also have one more problem, and this is that whenever I load up tcsh (I know, the wrong shell to use with 2mb) no resource file is loaded, and I have to fumble in the dark without a PATH variable until I can load it. I

have a path set up in mint.inf, and also have an /etc/login.csh and also a /etc/tcsh.rc. None of these seem to do anything.

Will the Mint X11 install onto a 2MB STE with only a medium rez monitor?

Does anyone know if the Mint NFS will allow serial communications with (for example) a PC running Linux....This is just for a bit of fun, so doesn't need to be robust.. :)

Well, I've gone and asked too many questions again...so I'll stop.
:
: Regards,
: --

John.

I use Oasis 1.35E on my Falcon but now and then while unbatching the news I get
Two bombs.
The only way to get rid of them is to throw away the batch.txt and load the new
news the next login.
Why does it bomb on news? If I use a couple of saved batchfiles they work but
whenever I try the 'bomb'batch Oasis stops and leaves to the desktop.
I use the NOS-POP..

Lottery Companion 3 for the Atari ST / Falcon etc., range of computers is now accessible from the Net.

LZH and ZIP versions can be found at http://www.demon.co.uk/sjspr/ftp/

This isn't strictly a FTP site - You will need a Web Browser - Unless you know different ?

Version 3.5 with a new Wheel 'Perm' option is being programmed now - It should be available in a few weeks.

Feel free to Mail me with any comments or questions.

Thank you to all those who have supported Lottery Companion. The 100'th Registered arrived this week.

Mark Butler, Atari ST Shareware Programmer and HTML Author.

>

I agree with this sentimentality! There is an awful lot of good software out there (gnu c, MiNT-Net, etc) that are a nightmare to unpack and setup because they were packaged by a U***x fan with a Minix partition and an intimate knowledge of what should go where, what environmental variables to set up and how to set up all the .cnf (etc) files that go with it. Would the people who write all this wonderful system software please use ZIP to pack the software and include a setup utility. Also, a simple step by step fools guide would save a lot of time and effort! It would certainly have saved me a lot of grief in setting up gnu C ... which I still haven't got working properly!

-David White

Diagnosing the Bloody Ascend Bugger :-)) ...

You've got one if it answers straight away without a ringing tone.
They are all called "finch" instead of "demon" at the login sequence,
except finch-193 which as everybody knows (?!) is actually a.demon
wearing the wrong hat so it can be ignored for these purposes.

After the logon type "ppp sl0" and see what is said about the "LCP"
line. If it mumbles about waiting for the remote host to open then try
"ifconfig sl0 up" (you need NOS 0.42 for this - printed when Nos
starts). Type "ppp sl0" again after about ten seconds and you should
see the LCP line has changed to something like "opened" which means
you are in business. All you have to do is plonk the "ifconfig sl0 up"
onto a function key and hit it when you get a finch.

There are more subtle and automatic ways that others have found to fix
this but this one stands the most chance of working.

This is a tricky one. Makefiles vary quite a lot. I think your best
solution is to post the makefile, especially if the code compilation
is dependant on preprocessor stuff defined (or not) within the
makefile itself. Some are written well, most are not.

On a good day, I might come up with a reasonable one. I don't think
I've ever done a good one -(

2223. DynaCadd for ST, registered copy

Newsgroup: comp.sys.atari.st
Date: 1996-02-02 00:00:00 UTC
From: fredu@enterprise.america.com
Message-ID: <4eu4kd$q2g@enterprise.america.com>
Source record: 151545

I have Ditek's DynaCadd for the ST for sale. It has been running on a TT030 and works great. I don't recall what version, but it was upgraded once from Ditek on the registration. It is the last version level to need the dongle, which is included. I understand that you can upgrade and drop the dongle. I will be glad to email or paper mail to Ditek the transfer of owenrship as the previous owner did for me.

Open to any offers, may reject ridiculous. Best offer in the next two weeks or so.

> only. :(

Well, if SETUP.PRG had done its work, you'd have got a filesystem that allowed
40-odd character names. The arguments go something like this:

minit -V -n 2 [-P | -
Z] F:

-P or -Z protect the filesystem from TOS in different ways, the -V tells it to
use a level-2 filesystem, and the -n <number> tells it to add <number>*12 bytes
for the space to the base 12 chars.

> : > I plan to use the Distrib_kit held at atari.archive, but the more I

Hmmm - lots and lots of people have successfully used the MFK to install MiNT,
with most errors coming from people not following the instructions. It does
crash on the more unusual hardware, but when it was written, there wasn't even
an STe model available - the only serious use of Ataris was on (Mega) ST's with
mono monitors.

There is also the point that it was intended for me and a couple of friends, it
was just so popular that it was made available for others. If you don't like it
then don't use it. Since I no longer own an atari, I don't have much interest in
updating the s/w. Of course, I'm glad that it 'paved the way' for Knarf's setup
so others who don't have the technical knowledge of how to set up a Unix-like
OS can easily install a fully working MiNT setup.

> I also have one more problem, and this is that whenever I load up tcsh (I

> /etc/tcsh.rc. None of these seem to do anything.

This is highly dependent on who compiled tcsh (I assume you have the binary-only version, not the source), as different people put the config files in different places. Use the source, Luke.

> Will the Mint X11 install onto a 2MB STE with only a medium rez monitor?

Yes it'll install, but you won't get anything to run. You get something like 1Mb free when X is running on a 4Mb machine, and that's with minimal clients (an Xterm, a clock)

> Does anyone know if the Mint NFS will allow serial communications with (for
> example) a PC running Linux....This is just for a bit of fun, so doesn't

Hi,

>I've tried you're GhostScript viewer, but one thing that annoys me, is that
>it only runs in either 2, 16 or 16.7 Mill. colors.

I assume you are talking about GS 3.53, since color was broken altogether in 3.33. It is SUPPOSED to work in 8 and 16-bit color modes also. I have only a monochrome monitor, however, so I have to program the color modes "blind". The only way I know whether they work is when someone tells me (by the way, you are the first person to tell me that 24-bit color works). If you can tell me what happens when you try to run in 8-bit mode, I may be able to correct the problem, but I don't promise anything because my Atari is almost dead.

One thing that might help the diagnosis is setting the environment variable "GS_DEBUG" to "gdebug". This will cause some diagnostic output to be printed to the screen. One of the parameters printed is the number of color bits that GS thinks it should use.

Chris -

If you can determine the 'delimiters' used as others have mentioned then Alpha Four on the PC will import almost any format, and you can specify the number of fields and delimiters used. It is DOS based, although there is a Windows version that I don't believe works as well. It will export to most other formats as well, if your desire is to use a different Dbase.

If you can grab a small chunk of your database and send it to me I can try to see if Alpha will do the job for you. I would need to know how many fields and the #characters in each. Alternately, if you want to create 3 to 6 dummy records in a new file using the same format as your original, then your data 'privacy' could be retained.

Good luck!

I find that my Atari Falcon is no longer meeting my needs, and I must move on to something else. 4 Megs of RAM, 85 meg HD.

$1000 or best offer + COD.

Source code to much of the software I have developed will be collected together, organized, and donated to any people who are still interested in developing Atari software. As Evan Langlois has seen, the terminal emulator that I was developing was remarkably faster than any other for the Atari, so many may find it useful to use that code.

From: "Robert L. White" <rwhit.ES_XC1@xerox.com>
Message-ID: <4erm4p$8i4@news.cp10.es.xerox.com>
Source record: 151595

I had that same problem
and cured it.
However I attempted doing several things to try to fix it before logging on to
my isp. Here is what I did. Which item fixed it I do not know.
I added all the ISP servers IP in the domain list
i.e. domain addserver xxx.xxx.xxx.xxx

Then I deleted the NNTP.dat file.
funny oasis and NOS never recreated that file again.
It seems to use the active.dat file instead.

That worked for me.

Hope it works for you.

Won't work. TOS 1.6 & 1.62 is an STe TOS. The closest Mega-compatible
equivalent is v1.4.

Of course, you could always get TOS v2.06, the board & ROMs for which
will set you back about $60 if gotten from Toad. If you think v1.02 is
bad, try the earlier versions, they be horrible!

>
2 Methods:

1. Install PC Exchange on your Mac format the DSDD disks as MSDOS 720K on the Mac, then copy the files on to the disks on the ST and then read them from the Mac.

2. Solder or buy a NULL modem lead and use a Program like ZTerm on the Mac and Connect or Freeze Dried Terminal on the ST to send the files between the two machines using the Zmodem protocol. (Slow as an unmodified ST serial port can only manage 19200 bps but there is no limit on the file size and can be done as a batch operation overnight without any intervention)

Ah.

>There goes my street cred. Kiss it goodbye dave...

To be fair, you did tell me so.

Anyway. You have two options: get a 'make' utility, or build a PRJ file.
(I guess you're using Turbo/Pure C...).

1) FTP a 'make' tool from somewhere, run some shell a la gulam or mupfel
(gemini) or whatever and type 'make'. Typing 'make -n' first might be a
good idea -- it will tell you what would have bene done had you omitted
the '-n'. Now edit the Makefile -- you'll probably have to add lines like
"CC=tcc" and modify lines like "DEST=/usr/local/bin".
You'll also (probably) modify the 'link' target from ${CC} to 'tlink'
with a bunch op options. Oh yeah, check the manual/on-line help for tcc
and tlink command line options. Or yell 'tcc -h' ('tlink -h'), even if
it's just once.

2) Read the Makefile. Interpret it. "Oh, so to build thisprog I need to
compile thismain.c to thismain.o, thistool.c to thistool.o and thisui.c
to thisui.o and then link thismain.o, thistool.o and thisui.o to
thisprog... I can do that". Once you have a superficial understanding of
the Makefile, you should be able to get a more or less functioning PRJ.

Cheers, J.
who is wondering, would there be some tool like 'make2prj'??

2245. Help with Mint

Newsgroup: comp.sys.atari.st
Date: 1996-02-03 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <4f0av7$1fb@madeline.INS.CWRU.Edu>
Source record: 151456

I just recently downloaded the 9 disk mint set, and the .ps
instruction sheets from the same dir. After a few false starts,
I got the system to load. I am using a 4Meg 1040STf with a
16 MHz ADSpeed accelerator. My Mint partitionhasa ☐☐
has been loaded into a 50 Meg partition on a 540 Meg HD using
ICD stuff (the latest ICD software). It goes completely
thru the 9-disk install process, and when I reboot, Mint.prg
seems to execute properlY(?) and I get TOSWin installed
as an accesory.
But taht's all I can get it to do. I know (or guess?)
that stuff is in there, cause Selectric finds a bunch of things
in disk U: and some other new drives, like Q, V, and X.
Obviously, i am missing something important. But I haven't
the slightest idea what. It may be a concept, a file, an init,
or a program --- but WHAT?
I am somewhat computer savvy, but have never used
Unix. When I open TOSWin, and click on open a window, It come up
with Selectric file selector. In one of the directories
it found term.000.
When I click on that, it opend a window that said <exited>
and then nothing. The .ps sheets only talk about getting
the system loaded, not about what to do then. I had expected
to load later versions after this, using the system, but
if the system doesn't work, I dont see how.
Is ther any text, or manual available on the net
about what to do next, or how to use it? Or anyone
with enough savvy and patience to help me via e-mail or phone
from Cleveland?

Prof. Boris D. Cahan

bdc2@po.cwru.edu

2246. Sell me TOS 1.6 or newer.

jhovila@muikku.jmp.fi (Jyri-Pekka Hovila) spake thusly:

JH> Just noticed my Mega 4 has TOS 1.02 -- urgh... So, if you've
JH> got the English TOS 1.6 or newer, I'll buy it..:)

Umm.. I don't think so. The highest you can put in your machine without some hacking is 1.04 (Rainbow Tos). It wouldn't be a bad choice; but I am partial to NewDesk, TOS 2 or higher. For that, you would need something like the Tos Extension Card. Toad sells Compatibility Plus, which uses TOS 2.06 in your '520, 1040 or Mega ST'.

Someone recently posted that TOS 1.6 was Rainbow. AFAIK, 1.4 is Rainbow, although 1.6 also has the scrolling fuji that provides the name to Rainbow. But 1.6 was written to support the 'enhanced' capabilities of the STe, and is not suitable for the ST, including the Mega ST.

2254. Massive IMG file problems

Newsgroup: comp.sys.atari.st
Date: 1996-02-03 00:00:00 UTC
From: andrew@ajrose.demon.co.uk
Message-ID: <823442574_OASIS_@ajrose.demon.co.uk>
Source record: 151465
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've just saved a Pagestream page to disk as an IMG file and it's come out at a whopping 3.3 MB. What on earth can I do with this, even on a 4MB STe? I'd like to convert the IMG to a more compact filesize, ideally a TIF or GIF file. I've never saved to disk like this before, so any ideas are welcome. The only idea I have is to reduce filesize by reducing resolution, yet I'm keen to preserve as much quality as possible - I want to send the page as part of a magazine article. Are there any "printer" drivers which allow disk printing in different formats, or image converters which will deal with such large files?

Andrew

> PENTIUM ... judas !! It should be a PowerPC, then again I haven't
> seen any spec for the (soon to be released ;-)) 68060 from Motorola.

68060 has been released for ages. I can get them
'fairly' easily for my Amiga 4000. Don't what to as I
don't need it (think my next processor upgrade for that
monster is the PPC CPU). The avarage price for 68060 CPU for
the Amiga2000 (there is only 1) is $1495.00 (US), Amiga1200
(about $1000.00), Amiga 4000 (about $1400.00).

>on news? If I use a couple of saved batchfiles they work but whenever
>I try the 'bomb'batch Oasis stops and leaves to the desktop. I use the
>NOS-POP..

This seems to happen in two ways - the obvious one is the fault is in batch.txt. The other is that the news you have currently got is buggy. Have you had any partial articles recently?

Go through all your groups and reindex them, better still expire them with a zero time length which has the same effect as removing and re-adding the group.

If that fails then you know the fault is in batch.txt - get a text editor to it or try and download that news again hoping it will go away, which sometimes works and is a lot less hassle.

If you want to reload the news then edit NNTP.DAT - the time and date are on the first line. Take it back to the required time.

The hassle ...

I forget exactly how the format goes but each article starts with "#! rnews". Do repeat searches until you find one that doesn't look right. also make sure there is a final one at the end of the file. Compare it against a working batch.txt so you know what is correct.

If the file is large then try continually bisecting it at the end of an article and place the final rnews at the end of each fragment. This will narrow them down to a reasonable size.

ad910@lafn.org (Bobby Swain) writes:

>I didn't know efficiency could vary within a given connect speed!
>Curiosity prompts me to ask how is efficiency calculated...for that
>matter, How does CPS relate to connect speed?

'CPS' is throughput, based on (obviously) characters per second.

'efficiency' is CPS as it relates to your serial port speed, _NOT_ your
modem speed. Hence, using the same modem at different serial speeds is
going to change the efficiency calculation, even if the CPS remains
constant.

>One packet came in at a blazing ~1000 cps (~70% efficiency).
>Most, however, were in the "normal" (for me) range of 700-800 cps.
>One came in at about 315 cps.

What you're seeing here is changes in data flow rates from the host you're
connected to. Even if you're connected at 14.4 continuously, that doesn't
mean that data is constantly being transmitted/received at a constant rate.

>open a window with the contents of that particular drive

[....]

>Hopefully people can add more guidence than I to this thread :)

Doesn't the Mac eject the disk in the drive if you lead it to the
trashcan? If this is so it can be potentially dangerous for a
Mac/ex-Mac user to try out an ST- because he/she will ofcourse delete
the whole disk if this is done!! (unless the disk is write protected
ofcourse).

Correct me if I'm wrong- I've only tried Mac machines a couple of
times and seem to remember this strange (an unlogical) thing about the
trashcan.

>>Secondly, what version is AW up to now?

>Only one version was ever released :-(

Actually, there _WAS_ more than one version, however the later version
was subject to what was lovingly called 'black page syndrome' on machines
with limited memory.

AtariWorks v1.2 is probably the safest release, and v1.206 (or was it 1.207?)
should be avoided. At least that's my understanding of it...

IMGs are fairly good compression. Switching to tiff or GIF wouldn't save more
than 10% or so. (assuming Pagestream saves properly compressed files that is)
If you want to get it significantly smaller you would need to go to jpeg or
another lossy format - but then you lose quality.

I can't think of any way for you to convert it though when it's too large to fit
in memory (you might just get one to work if you removed all accs and auto
programs?)

> graham@grasper.demon.co.uk (Graham Irvine) said:-

> >So waffling aside ..anyone seen an FTP site with this app on it ??
> Its been on 42BBS for some days now but didnt appear on the Hensa
> falcon news dated 22nd Jan (maybe in TOS section which hasnt sent a
> news recently AFAIK.

no , hensa hasn't updated for a little while ... I know that some none listed
files have been uploaded there , is there an incoming directory on hensa ??

don't know about subscribing to AW disks but I think I perhaps have been
neglecting my fido system recently .. the FAN file network is normally
pretty quick at bringing things like this to you , I suspect this is where
42BBS got the file from ..

2265. Falcon keyboard problem.

Newsgroup: comp.sys.atari.st
Date: 1996-02-03 00:00:00 UTC
From: george@nmt.edu
Message-ID: <4ev3k1$h55@newshost.nmt.edu>
Source record: 151476
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hello all,

I having a problem with my keyboard on my stock Falcon 030. I'm hoping that someone might have an idea on what is wrong.

Sometimes the keyboard "gets stuck". There are three symptoms. Most often it appears that a key gets stuck, just a constant key click coming from the speakers. Sometimes the click is in a repeating pattern, a series of around 5 clicks then a pause, over and over. A few times no clicks, it just quits. Almost always once it starts the keyboard (and mouse BTW) is completely non responsive. The few times it does respond it starts again within a few seconds. It has never come back a second time. This problem doesn't seem to effect anything else of the computer, programs running continue to run. While watching in a text editor, it will display characters just like you are holding down a key. The character changes each time this happens, running the range of all the characters.

I have swapped keyboards with no change. I have booted with no floppy and no hard drive and it still happens. I have also changed ram boards. It doesn't appear to be heat or time sensitive. It just happens when it happens.

Any ideas? BTW anyone know what the chip labeled

TIF301 FS
7406

is? It's the one sitting next to the keyboard jumper and appears to be connected to the keyboard through the jumper. Hopefully whatever is wrong is something common that I can get fixed locally.

Thanks,

George

2266. Atari 1040ST for sale

Newsgroup: comp.sys.atari.st
Date: 1996-02-03 00:00:00 UTC
From: mtwilson@nr.infi.net
Message-ID: <4f0hpc$4t0@nw002.infi.net>
Source record: 151477

I have an Atari ST that is collecting dust. I want to send it to a home where it will get used. It includes the following:

1040STe computer system with 1meg ram
SC1224 Color monitor
3.5" single sided external floppy drive
Trackball, mouse, several joysticks
Lots of software

$200 or best offer (buyer pays shipping)

Interested parties please send email to: mtwilson@nr.infi.net

2267. FS(USA): Rare and nifty Atari stuff

Newsgroup: comp.sys.atari.st
Date: 1996-02-03 00:00:00 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <4f0kqm$p7o@news.fsu.edu>

- Highlights -

Modem powerusers: 16mHz MegaSTE4 with modified serial port hardware available!
Moniterm 19" 1280x1024 monitor, with graphics card for ST!
Super cheap full-page scanner!
Two Syquest 44mb removable-platter hard drives, and 20 cartridges!
Custom hard drive subsystems, with or without a Syquest!
Excellent desktop publishing software!
Some of the best games ever written for the ST, including descriptions!

Below are a bunch of ST items I want to sell or trade. For buyers, highest reasonable offer gets the item, with preference going to those that buy more than one item. Shipping will be negotiated with the offer.

As for trades, let me know what you have and we may be able to work something out. Cash can make up for deficient trade material from either party. Shipping will be negotiated with the trade (though for trades, I often suggest that both parties eat the shipping). Don't be shy, send me some email and let me know what you have to trade.

With respect to trades (or outright purchases by me), I'm particularly interested the following items. Please email me if you have any available.

1. 1040STE or 1040STFM computers (see below).
2. Jaguar systems, games, accessories.
3. Lynx systems, games, accessories.
4. T16 or ICD AdSpeed 8/16mHz switchable processor upgrades.

All of the items below are original commercial products owned by me. Unless otherwise noted, all original boxes, manuals, and disks are included. I have cheats for some of the games, and will include them with the sale/trade.

PLEASE MAKE ALL REPLIES VIA EMAIL.

****Systems****

OK, I want to get rid of my current two systems, and obtain two others to replace them. I currently have:

MegaSTE, 4mb RAM, DSDD floppy drive, TOS 2.06, 8/16mHz M68000 processor, does not have the DMA stereo sound problems sometimes present on these machines (warranty repaired by Atari), serial hardware has been upgraded using the improved GAL logic as described by the fser096.lzh file on atari.archive.umich.edu (this consisted of a one chip replacement, the new chip is more efficient and bug-free than the Atari unit). One standard ST serial port (19,200 max), two absolutely rock-solid enhanced serial ports

(115,200 and 153,600 max). This machine is completely stock, except the serial chip upgrade (which is really really nice for owners of 14400 or 28800 baud modems). Detachable keyboard (the best Atari keyboard every made, IMHO). Big wedding-cake design case, weird but cool. This machine did not come from Atari with a hard drive (as some did), but one can still get the kit to install one (includes a new plastic cover piece, and an Atari internal host adaptor). It is in like-new condition.

MegaST2, 2mb RAM, DSDD floppy drive, TOS 1.2, detachable keyboard, bog standard, perfect shape. Includes high-speed megabus internal connector (required for Moniterm 1280x1024 and other graphics cards).

And instead, I want:

1040STE, 4mb RAM, TOS 1.62, internal DSDD drive, clean (no roach-colored smoke-stained music studio machines please). In my wildest dreams, I would find one with a T16 or ICD AdSpeed 8/16mHz switchable processor upgrade installed. Barring that, I'd like to find such an upgrade and install it.

1040STFM, 4mb RAM done with some decent memory upgrade board, TOS 1.0, clean, ditto on the processor upgrade.

Why? Since moving my work environment over to my beast of a Linux box, most of my ST time is spent playing kick-ass arcade games, for which there are few PC analogues (I've got plenty of excellent PC games as well, but sometimes I feel like racking up a few zillion points in Revenge of the Mutant Camels, eh?). I'd like to move my ST gaming out to the big TV in my living room. My current systems have to be desk-based, as they have detachable keyboards (plus the Mega2 doesn't have an RF modulator). Also, the MegaSTE has some irritating compatibility problems with older games, due to TOS 2.0x's slightly modified bootup routine. It is, however, the best 68000 based ST/STe ever made by Atari, IMHO. For those used to a stock 8mHz ST/STe, they scream (granted, a fairly weak scream by today's standards, but dramatically faster than 8mHz boxes). Screen response time that can match current 28,800 baud modem technology can be attained, along with the serial hardware needed to get full performance from these devices. Those games that can handle both TOS 2.06 and 16mHz mode are usually MUCH better that way.

(Jeez, what a shameless plug. It is a sweet machine, though.)

Anyway, I'd like to replace my two systems with two of the "one piece" design, both with RF modulators for easy TV hookup. IMHO, my current systems are superior for serious work (the detachable keyboards are great, plus all the other nice things about MegaST/STE machines), but inferior for the kind of gaming I want to do. Ideally, I'll be able to preserve my 16mHz capabilities via a processor upgrade.

If you have a machine that fits my bill, and would like to sell or trade it, please let me know. If you just want one of mine, email me an offer. I don't need any SIMM memory in either machine. To save myself from some lowball offers, let me go ahead and state that I feel that these machines are worth more than the 1040ST(e)'s I am searching for, so I'm not going to trade my MegaSTE for a 1040STE without some further incentive (ditto for the

Mega2ST/1040STFM trade).

****Other Hardware****

Moniterm 19" 1280x1024 paper-white monochrome display, absolutely the best way to do DTP (and just about any other kind of serious work) on the ST. Comes with the special video card that plugs into the Megabus on MegaST machines, plus software drivers. Case is cracked in a couple of places, but still perfectly functional. Requires TOS 1.4 or higher. Virtually all "serious" software supports the higher resolutions without modification (all GEM compliant programs are supposed to check, and most do). The desktop is HUGE, equivalent to slightly more than 4 normal monochrome displays. For DTP users, you can see two full 8x11 pages side-by-side at actual size. The display is sharp and easy on the eyes, like a well-adjusted SM124. Shipping costs would be nontrivial on this item, as it weighs a ton. This is definitely "poweruser" material. Unless you have some sort of custom graphics card, you MUST have a MegaST machine (not MegaSTE) for the included graphics card to work (of course, I happen to have.... :-).

Img Scan, optical scanning head that attaches to most dot matrix print heads to produce a scanner. The printer is used to position the material to be scanned, and is capable of very high accuracy. Great way to start playing with scanning technology. Several versions of the software included. Plugs into the cartridge port.

Spectre GCR, cartridge and software that will emulate a Mac Plus, including Mac floppy operations. Latest version (3.0) of software included. I can also provide Syquest 44mb cartridges with the Mac system software preinstalled (Syquests work perfectly in Mac emulation mode).

Monitor Master monitor switchbox, switch between color and mono displays with the push of a button. Also provides sound and video output jacks.

Syquest SQ555 44mb removable platter hard drive, fully supported by all Atari hard drive software. Standard 50 pin SCSI interface, 5.25 half height, bare device. I have two of these available.

Syquest 44mb cartridges, made by Syquest. I have 20 of them, no bad sectors, factory plastic library case included with each.

Quantum Prodrive 80S 80mb 3.5" hard drive, standard 50 pin SCSI.

Seagate ST296N 85mb 5.25" half height hard drive, old and huge yet reliable as a rock (for me, at least, as it was my first drive :-).

ICD AdSCSI Plus host adaptor card, includes card, DMA cable, ICD manual, version 6.55 of the ICD utilities, 50 pin internal SCSI ribbon cable, mounting hardware.

I have a few hard drive enclosures, and could produce a nice external hard drive subsystem for the ST using any combination of the storage devices

listed above. Syquests are extremely cool, particularly for making backups (Diamond Edge can do a 44mb partition copy in just a few minutes, really really fast). So, if there is interest in a plug-and-play hard drive subsystem, let me know.

****PC Hardware****

Adaptec 2940W PCI Fast-Wide SCSI-2 disk controller, one of the fastest SCSI controllers available for the PC, OEM version, still factory sealed (i.e. totally unused). Includes card, cable, manual, driver software. Supported by DOS, Windows, Windows 95, Netware (Novell), Solaris x86, Linux, etc. This card provides connections for both Fast SCSI-2 (50 pin) and Fast-Wide SCSI-2 (67 pin) devices. These go for around $300 in Computer Shopper.

****Application and Utility****

ExtenDOS v.1.21, software to allow use of standard SCSI CDROM drives on Atari ST machines.

Tempus v1.x, excellent text editor, not as good as Tempus II, but no slouch either. Blazingly fast (hence its name), even on a box-stock 8mHz system. Designed for programming, great for general editing as well.

Degas Elite, one of the best ST drawing programs, can edit or create P?1, P?2, P?3 files.

Pagestream 2.20b, complete DTP system, can produce output on a variety of devices, including PostScript. Comes with a bunch of fonts.

Page Assistant, excellent hypertext help accessory for Pagestream. This product makes Pagestream a vastly more user friendly product. The online manuals provided are better than the printed one that comes with Pagestream. Really a must-have item for Pagestream users. This combo provides a powerful DTP environment.

TurboJet, Neocept, fast GDOS print driver for HP Deskjet and Laserjet printers, includes a bunch of 150 and 300dpi fonts. Claims to be 200-500% faster than other HP drivers (for that time, I don't know if there are faster ones out now).

Image Cat, Wizworks, v1.0e, this program catalogs all kinds of image files (.img, .pi1, .pi2, .pi3, .pc1, .pc2, .pc3, .tny, .neo, Macpaint). It makes "summary" or "thumbnail" sheets which have the images on them (reduced), with file name and directory information. You just point it at a directory and it prints out the images. This is great for DTP folks with a lot of clip art. Printer drivers for SLM804, HP Desk/laserjet, NEC LC890, Panasonic KX-P4450, Epson LQ and FX.

Microsoft Write for ST, buggy WYSIWYG word processor, the only Microsoft product ever made for the Atari that I know of, includes a full copy of Atari GDOS. Can be run from floppies and a ramdisk (Jeez, did I really do that? I must have been really patient back then :-). I managed to produce a bunch of papers and letters with it using only

a floppy and color monitor, so it is usable, though certainly not
state of the art.

CAD 3-D v1.0, Antic, original disk accidently laundered (don't ask :-),
includes original docs plus backup floppy. This is not really for
architectural design (i.e. Dynacadd or Autocad), but to make nifty
3D animations for fun.

****GAMES****

Games marked with a * are, in my personal opinion, really killer games. No
ST game collection should be without them.

* Dungeon Master, one of the best 1st person graphic adventure games ever. An
absolute classic for the ST. Will include a disk of maps for all the
levels, and a nice spell chart. No ST owner should be missing this
game! No box.

* Chaos Strikes Back, sequel to Dungeon Master, another classic. No Box.

* Populous II, extremely cool god-game, one of the best ST games ever
produced IMHO. STE enhanced.

* Time Bandit, one of first ST games ever, Michtron. This is yet another
classic that no ST should be without.

* Operation Thunderbolt, sequel to the arcade game with the plastic Uzi
submachine gun mounted on it. Uses mouse for control, excellent
"blast everything" game. Great explosion and gunshot samples.

* Warhead, excellent space flight/combat adventure game, exceptional 3D filled
vector graphics and sound.

* Magic Pockets, platform game by the Bitmap Brothers.

* Escape from the Planet of the Robot Monsters, cool two player simultaneous
game.

* Vroom and Vroom 2, my favorite ST driving game, uses mouse for all controls,
nice filled vector graphics, very very fast.

* Speedball 2, bionic-enhanced brutal futuristic football, excellent two player
simultaneous game.

* Thunderhawk, one of the best combat flight simulators for the ST, pilot a
futuristic gunship all over the world. Filled 3D vector graphics,
excellent flight engine.

* Elite, starfaring free-for-all adventure game, a classic for the ST.

* Robocop 3, awesome ST arcade game, includes a combat driving game, 3D third-
person fighting game (virtua-fighter style, though not as pretty),
and a Doom-style 1st-person shoot'em up phase (no texture mapping,
bummer). Great game. STe enhanced.

* Menace, Psygnosis, side-scrolling "blast everything" game, very fast, very good. This is the precursor to Blood Money.

* Hard Drivin 2, 3D filled vector driving game, stunt and racing tracks, can play via serial link with ST, Amiga, or IBM PC versions of the same game.

* Armourgeddon, Psygnosis, excellent combo-game, battle a variety of enemy craft in a huge virtual world while piloting hovercraft, tanks, jets, gunships, or bombers. Cool combination of arcade action and strategy. Two player cooperative play via serial link, really cool that way.

* Wanderer 3D, super-cheesy game with one overwhelming redeeming feature: 3D glasses are included. Pretty nifty, though you will go blind if you play too much :-).

* Super Hang-on, one of the best motorcycle racing games for the ST.

* Prince of Persia, platform game, but with much finer control of the computer player than most such games. Cool swordfighting phases coupled with challenging level-completions.

* Gold of the Aztecs, platform game with huge sprites, great graphics and sound.

* North and South, strategy wargame with lots of tongue-in-cheek humor, based on the popular French comic. Very well done, and can be configured to play itself. Really shows off an ST.

* Flight of the Intruder, Spectrum Holobyte, full-blown Vietnam flight simulator using an improved version of the Falcon flight engine, pilot A6 Intruder or F4 Phantom jets, serial-linkable two player (awesome head-to-head fighting is possible with two machines).

* Hostage Rescue Mission, control the actions of a team of elite counter-terrorist troops. Great blend of strategy and arcade action.

Driller, 3D filled vector first person arcade adventure, huge game space, similar to Descent on the PC (no texture mapping, of course).

* Stunt Car Racer, One of the best car racing games for the ST. Two player null-modem game is excellent. Original disk, xeroxed docs (I lost my original docs).

Moon Patrol, Yes, the original arcade game. Side-scrolling car game, jump over holes and shoot flying saucers. Conversion done by Atari, just like the original. Original disk, no docs or box (docs are not needed for this game).

Blacklamp, side-view platform game. Collect all the lamps to fight the dragon. Excellent graphics and gameplay.

Barbarian II, This is the sequel to Deathsword, the one or two player sword-fighting game. It is not the Psygnosis adventure game. This is a blood and guts action fighting game. Excellent.

Double Dragon, one of the first beat'em-ups for the ST. Dual player mode
is cool. Multilevel side-view platform fighting game. Good.
Original disk, no docs/box (unneeded for the game).

Sega Master Mix, this consists of five separate games: Super Wonder Boy (cute
isometric arcade game), Turbo Outrun (Ferrari driving game),
Thunderblade (combat helicopter game), Dynamic Dux (isometric
arcade game, punch bad guys, cute, fun two-player simultaneous),
and Crackdown (isometric view "go kill all the bad drug dealers").
All of these are arcade conversions, and all are of good quality.

Awesome, Psygnosis, Several different types of action game rolled into one.
Excellent shoot-em up game, graphics, sound, and gameplay all first
rate. This one really shows off the machine.

* Wrath of the Demon, side-view scrolling action/adventure, excellent graphics,
sound, and gameplay. Four disks (!), extremely challenging, STE
enhanced. This is another one that really maxes out the ST/STE
hardware.

* F-19 Stealth Fighter, Microprose flight sim, lots of maps, manuals, keyboard
templates, etc. Excellent simulation, allows one to fly either the
F117 or the F19 (hypothetical plane based on early artist's
conceptions of the stealth project).

Swiv, overhead view jeep/helicopter shoot'em-up. Simultaneous two player
mode, STE enhanced graphics and sound (will work on ST as well).

* Jupiter's Masterdrive, Ubi Soft, excellent excellent overhead-view driving
game with guns. Drive on the moons of Jupiter. Extremely cool
simultaneous split-screen two-player mode.

* The Chaos Engine, Bitmap Brothers, STE enhanced overhead-view one or two
player simultaneous game, excellent graphics and gameplay. The
Bitmap Bros. don't make a crappy game. This one is great. For
MegaSTE owners, I can provide a version of the game that works on
this machine.

* Alien Syndrome, overhead view scrolling shoot'em up, lots of fun for two
simultaneous players. Plenty of fast and furious shooting, lots
of weapons, little droids that follow you around and help you out,
big ugly aliens, etc. Great game.

Captain Fizz Meets the Blaster-Trons, Psygnosis, sort of like a Gauntlet II
in space, best with two simultaneous players (screen is split to give
each player their own view). Overhead view, destruction galore.

* Baal, Psygnosis, Excellent platform/adventure game (mostly arcade action).
Future setting, sideways scrolling, large sprites, good guns. This
is a pretty hard game, but lots of fun.

Sidearms, Capcom, scrolling sideview shoot'em up, mouse controlled, lots
of weapons and powerups. Great "mindless destruction" game.

Enduro Racer and Crazy Cars, combo pack, no docs, Enduro Racer is a cross country motorcycle racing game, Crazy Cars is a racing game. Both are OK, though quite old.

Super Cycle, Epyx, no docs, oval track motorcycle racing.

Eliminator, strange driving/shoot'em up game, lots of different weapons and bad guys.

Frostbyte, Starsoft, side-view platform game, I would recommend it for a small child (in terms of its difficulty). A bit boring for us big children, IMHO.

President Elect 1988 edition, SSI, presidential election simulation, graphics are quite lame (mostly text, in fact), but I suppose a political process fan might like it. It does not appear to be particularly tied to the 1988 elections, and has data for US elections all the way back to 1960. Can apparently be used to predict elections as well.

****ST Action Magazines (with coverdisks)****

Issues available: 26, 43, 50, 51, 53, 54, 55, 56, 57, all include coverdisks.

These mags are great for game fans. The reviews help one avoid poor games and select good ones, plus there are cheats for the games, how-to-play guides, and useful non-game related articles (hardware reviews, expansions, etc.). Also, they all have a "best ST games to date" list in them, which is a great way to select the "best of the best" when game shopping (for example, from discount houses who only list the names of the products, with no descriptions). Finally, the cover disks that come with the mags provide demos of games (so you can try before you buy), plus full PD/Shareware games and other software. Most come with two disks.

Also available: three ST Action binders, each will hold about 12-14 issues without any damage or modification (wire-in-the-middle style) and make it convenient to leaf through the mags. Sold/traded only as a group. These are well made, nice looking binders with the ST Action logo on them. Will hold any of the large format UK magazines (A4 size, I think).

: Does MagiC 4 allow more than six accessories?

No!

However
a) you might want to start the ACC as a program
b) Magic4 alloaws to run desk acessories directly, by double clicking on them; control click into the desk menu will terminate them, so youneed not boot up with the desk accessories

Yes, just one of the NON-intuitive features of the "world's most
intuitive" GUI! :) I also like the dialog boxes that come up and say:
"System error, your hard disk has just been trashed. Click on OK to
continue."!

I'm repeating myself, but I've been using the 1.02 version of the
Zmodem module for STorm and it seems to work fine. What problems have
you encountered with it?

2273. Looking for programs... Can you help me.

Nope! I recieved base 64 encoded Jpegs from a friend of mine who uses
a Mac and ESScode decoded them fuss free in seconds. I don't know
which Mac program he used to prepare them but I can find out if you
want to know.

Cheers

Ed.

>It works tough.
>Want I dont get is that in NOS you can set your IP address
>i.e. NET> ip address xxx.xxx.xxx.xxx
>but doing that doesnt seem to work as my ISP says I am still
>using the IP address I had set in Oasis.
>Hmmmm if that did work I could use the login script and when nos starts set the
>IP address rather than having to use the simple term program routine.
>
>Anyway thanks for all who put these packages together
>I tought the ST would never make it on the net!!
>I will have to register Oasis, etc.. They are worth it!

--
I can't understand why it seems so many people are having such a hard
time configuring Oasis .
1)Put your IP address in the Startup.Nos if you have a Static address
that is . If you don't that might explain your problem .Ask your
provider to give you one and set it in your Startup.Nos and that will
end your problem of having to use a Moden to get your IP address .
2) Set up your Dial.Txt file with your login name and then your
password and save it .

Now you shouldn't be having anymore hassles .

esherman@umich.edu (Erika) said:-

>Can someone please point me in the right direction for this information?

First of all you connect Hard drives to the DMA/ASCI prot thing not
the external drive port and secondly to be blunt, just forget IDE
drives, they may be cheaper than SCSI but adapter boards are very
expensive.

If you removed the IDE it would boot off the scsi, if both are available then
I think it will always boot off the IDE, at least as far as loading the driver,
But some hard disc drivers will let you choose what partition to use as the
boot drive so you could continue booting from the scsi after loading the driver
off the IDE.

No help for Pagestream - the time this program takes to start depends on available RAM size. I used this program on a 2.5 MB ST and a TT DTP workstation with loads of RAM - on the ST, the program loaded quite fast, and on the TT, it took ages.

bye, Peter

>Hey does the internal IDE drive on the Falc have to be the boot drive?
>Mine is fla-ky...getting an external SCSI drive, it can be a boot drive
>right? Quick response? Thanks!

Two ways to get the machine to boot from a SCSI drive:

1. Remove the IDE drive.

2. Use an advanced hard disk driver, like Hard&Soft's SCSI-Tool. Place the autobooting driver on the SCSI drive, and rearrange the drive detection sequence (using the driver configuration tool), so that the "IDE unit 0" drive is after the SCSI drives.

The Falcon will then read all boot sectors, starting on the IDE drive. If it doesn't find a bootable driver there, it inquires all SCSI units until it finds one. This sequence cannot be altered.
The driver found on your SCSI drive then is loaded and started. Now the driver takes over, again scanning all drives, but now doing it in the sequence you configured, thus mounting the SCSI drive first, beginning with drive letter C.

bye, Peter

(btw, what exactly is flaky on your IDE drive - maybe I can help. State maker and model.)

>1.207?) should be avoided. At least that's my understanding of it...

Works itself is fine in version 1.207. The "black page syndrome" comes from the
GDOS driver not having enough memory to print the page.

Ha spot on, I enjoy flicking through PC progs, and thinking how small
they'd be on Ataris.... Case in point is Program Called WinStrobe: I
strobe-o-scope prog, that flashes the screen various colours at
various speeds. If I remeber rightly the program took about 1Mbyte of
HDD space !!! I think that really is going OTT. Even in something
Like GFA Basic, something like that wouldn't take more than about 20K,
and thats with sloppy coding.

I'm not going to speculate why but almost all PC progs I've ever seen
are about 10 times the size of a similar ST prog... and as for a 500
Meg OS I wouldn't be at all surprised !

>>
>> In the future, programming will be as easy as creating

I once did the same thing except I printed as a PostScript file. The single
page created a file that was over 6Meg! BUT! Try ZIPping that file and
it came in at about 90K. Go figure. I uploaded the .ZIP to a service
bureau, they UNZIPped and printed my 6+Meg file with no problem.

The following Atari ST Software is for Sale:

All are 3.50 disk, have original manuals, boxes, and are in very good condition. Prices are in American funds. Shipping included in price.

Lemmings ---------- SOLD!
Megal Lo Mania * ---------- $13
Moebius ---------- SOLD!
Spirit of Excalibur + hint book ---------- $15
Ultima IV ---------- SOLD!
Ultima V ---------- SOLD!

* Mega Lo Mania needs a boot disk that changes the monitor to a different MHz. I don't have this disk but I am sure one can be found on the Internet.

Thanks for the info. Commercial St hardware seems to be harder to get in the UK. I will have a look anayway.

2298. Looking for DTP stuff!

Newsgroup: comp.sys.atari.st
Date: 1996-02-04 00:00:00 UTC
From: lwright@kelowna.awinc.com
Message-ID: <4f1q5r$f0h@kryten.awinc.com>
Source record: 151411

I'm looking to TRADE for some DTP stuff. Specifically,

Calamus SL (With books, and hopefully some external modules)
Didot Lineart... Genus font editor, any other cool apps for DTP.

I'm also interested in 19" mono monitors, DEKA boxes, graphics carts (For my TT), conversion utils (To & From EPS would be nice, ditto for PS fonts)

I'm looking for Calamus fonts, I have 800+ I could trade for new ones.

I have to offer all sorts of software (Email me if you're looking for something) as well as a couple of NEW Mega 2s, with custom touchscreen controllers (No midi, alas) leftover from a failed business venture.

Also, I have the following and am looking for some other stuff (At the end of the post)

For TRADE

1 NEO GEO Gold w/
2 controllers Samurai Shodown 1 & 2 Alpha Mission 2
A/V cable RF switch boxes for everything
TWO memory cards Gamest SamSho2 game guide from Japan

2 Pioneer LD player w/Aliens & Cliffhanger

3 NES Large POWER GLOVE IN BOX

4 Turbo Duo Games from Japan
Cho Aniki Ai Cho Aniki R Type Complete
Side Arms Special Super Raiden Dracula X
Lords of Thunder Bomberman '94

5 Atari 7800, 2600, 5200 (all in boxes)

6 Sony PSX games
ESPN Extreme Ridge Racer Air Combat
DOOM XCOM UFO Loaded

WANTED:

The Lover and Koyaanaquatsi LDs Akira LD
PC Engine/TG-16 Laser Active pak NEO GEO CD System
MiniDisc player Vectrex System Wipeout (PSX)
Atari Lynx Turbo Express Other Cool Toys
Atari Jaguar w/Defender 2000 & CD ROM

L.

2299. Falcon for sale

Newsgroup: comp.sys.atari.st

Source record: 151413

You can move files twixt Mac and Atari by writing them to MSDOS formatted
disks, which both systems will read.
Atari formatted disks won't work.
But the Atari can read and write MSDOS disks
And so can the Mac through PC exchange.
I've used this method to move ASCII text files and Photoshop .raw format
picture files with no problems.
Bye
Martin

2302. Hard Drive Formatting Problems - appreciate some advise.

Newsgroup: comp.sys.atari.st
Date: 1996-02-04 00:00:00 UTC
From: pdcooper@adware.co.uk
Message-ID: <4f30rp$7bs@news.aladdin.co.uk>
Source record: 151415

Hi there,

I would appreciate any help from anybody who may have a fix for the following problem.

My friend has an Atari ST, the hard disk is an Atari Megafile 30 (with according to Atari UK, a Seagate ST237, inside!?) We have used the following programs to re-format and partition etc.
HDX.PRG - Atari Advanced Hard Disk Utility V5.00
AHDI.PRG - V5.00
HINSTALL.PRG - V5.00

Everything appears fine after formatting etc. Using a program called AUTOVER.PRG, no problems exist.

After copying files back onto the drive and running AUTOVER.PRG again the following errors are reported.
FAT COLLOSION - Inconsistent File Size Bad-end.

The problem basically gets worse and worse with use with:-
Subdirectory invalid, Orphan Files, FAT's Differ, Directory Collision etc. This continues until all files are corrupt and we need to reformat again.

Are we using the right software but wrongly? Are we using the wrong software completely.

Anybody got any ideas, Thank you very much in advance.

Kind regards
Coops.

2303. GEMULATOR problems - help needed

Newsgroup: comp.sys.atari.st

From: rvwelk@innet.be
Message-ID: <4f25ui$32c@news.be.innet.net>
Source record: 151416

I have a Pentium 75 with a GEMULATOR card v4.0. My PC works in WFW3.11
and the emulator card causes me nothing but problems.

My mouse is not working correctly
Some folders cannot be opened
The applications won't start

What is all of this about? Do you have the same card and the same
problems?
Please, if you had the same problems or simular experiences, let me
know how I can resolve this or where I can find some help!

Thanks in advance

RVW

(Humble voice) Serves you right for using Oasis to read your news !

Use AtariNOS and you won't get shortened messages when they exceed
the length stated in the 'Lines' line in the header.

Oh well, just another Oasis 'feature' - I could never work out why
to scroll up and down a message you had to use the horizontal scroll
bar - probably just me !

By the way, the message ended 'OUT YEARS AGO' - but what would that
idiot know. I'm happy with my Falcon and sticking with it.

My Falcon has very similar problem, too. I didn't know it was common to
somebody else (at least two people.). I tried everything I could think of,
replaced the keyboard, tryed AT keyboard interface, checked whole HDD with
UVK, resetting NVRAM, etc etc. I now think there is a hardware faulty on
motherboard it self. If anybody know a way to cure this, like replacing
a resistor near blah-blah chip, please tell me how.
Actually I gave it up about a month ago, I bought another Falcon because
I use the computer everyday at my work. this was a only choice to me.

Takashi

But Guy, this is so typical of the people that don't have the ability to
think for themselves. Let's just watch the pretty adverts on TV and in the
papers, and believe all the hype about PCs, and then blindly go out and buy
a clone machine just so that me mates don't laugh at me.

My mates (PC and Mac owners) often comment on how efficient and easy to use
my ST set-up is. Plus on occasions will happily admit that the final output
from my ST on paper is just as good or even better than PC or Mac output.

Apart from which, the ST is an 10 year old machine, but it still does it's
stuff, can you say that about a 10 year old PC?

Thank goodness most ST/Falcon owners can think for themselves and ignore
such nonsense from people like this :-)

Flame :-)))

There is a great program called X Change which converts both ways between EPS and CVG. I have the registered version, but there is a shareware demo version around. In fact the program has been developed recently and the latest version will even convert colour stuff. And a future version will even allow you to convert Corel Draw (CDR) format stuff. The only exception is that the program doesn't convert from CVG to GEM, or indeed any format to GEM metafiles! This is amazing considering how popular GEM format is on the ST.

Other than that, the program is great, and all the files I have chucked at it seem to have been converted fine. I use it for converting WMF to CVG, and I see no problems in my files.

Hi tderrick (?),

My problems with Okami are solved now, thanks to the wonderfull help of
Maarten & Jos.
Anyway, about those files; yust klick them ones on the desktop and click on
"s" (if you have TOS 2.06 like me) for "Show Information", after which you
can rename the file and do anything with it you please, in my case that was
deleting. :)

2313. Writing a custom print driver?

Newsgroup: comp.sys.atari.st
Date: 1996-02-04 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <4f2pel$j8b@gti.gti.net>
Source record: 151426

I am wondering if it is possible for me to write my own custom GDOS printer driver? I have an Okidata Microline 182 Turbo, and it's pretty non-standard, and I was hoping that there would be a way for me to set up GDOS to use it. Unfortunately, it's the "Turbo" in the model that affects the use of it: for example, Microsoft Windows drivers often supplies 182/192 drivers, but these don't work with the "Turbo" line. I do have the manual that came with the printer and it explains all the special escape codes and whatnot.

Thanx

This garbled offering from jhovila@muikku.jmp.fi to All was spewed forth...

Hello Jyri-Pekka....

j> Just noticed my Mega 4 has TOS 1.02 -- urgh... So, if you've got the
j> English TOS 1.6 or newer, I'll buy it..:)

I could sell you mine.. but it wouldn't be any good to you! AIUI you can only upgrade the Mega 4 as far as TOS 1.4, which is cosmetically the same as 1.6. The only difference is that 1.6 utilises the extra features of the STE.. which you don't have in your Mega 4.

You would be /much/ better getting TOS 2.06..... but if you are thinking of getting MagiC ever then don't even do that! MagiC replaces the operating system and requires that you run an external replacement desktop, so if you bought a TOS upgrade you would be wasting your money (like I have done!) ;-(

Get MagiC.. you won't regret it! :))

It is a resistor problem on the board. I had this problem back while my machine was still under warranty. It started out clicking then got to the point the machine was just unusable. I will try and look in my machine and locate the fix. Someone send me email to remind me.

2316. Some Fixes for Common STiK problems

Newsgroup: comp.sys.atari.st
Date: 1996-02-04 00:00:00 UTC
From: ackerman.29@postbox.acs.ohio-state.edu
Message-ID: <ackerman.29-0402961501310001@gb107samac.acs.ohio-state.edu>
Source record: 151429

Here is a list of some common STiK problems that I've either figured out myself or am pulling out of memory from the newsgroup. I'm sorry that I can't attribute the original authors of these.

1. STiK needs to have either Hsmodem or Fserial installed. It is linked with a library that makes calls to these programs. I would recommend Hsmodem over Fserial, but on some people Hsmodem doesn't work.

2. CAB reports can find 00000001.htm. Take out a text editor and create one. It doesn't need to have anything in it. Just open a new file and save it out to your cache directory under the appropriate name. (I can't remember if the above one is correct, however.)

3. Telnet looses characters or lines etc... It's not actually losing them it's just lost it's internal pointer to it's MFDB so it's blanking the lines. The best fix for this I've found is run Telnet under a monochrome screen.

4. Telnet doesn't seem to connect to my account. This can be brought on by a slow net connection at any point between you and your account. When Telnet attempts to connect through port 23 (Telnet port) it has an amount to negotiating it has to do. If you happen to be stuck on the information bike path then this can take a long time. The problem really gets bad if it exceeds 60 seconds as this is the default log out for logging in to most systems. One thing you can try is typing in your username while you are waiting to connect. This will sometimes expedite the process. You may have to play around with this. On one of my accounts I get a bit of the negotiation that fails, so that the first character in my first login prompt is a junk character. So when loging into this account I hit 'ret' then my username 'ret'. This usually works, but if it's an especially bogged down time I may have to try more than once to get in.

5. "When I close a connection under Telnet it gives me an error on the screen". This you can ignore. This is just what the close command is telling you. If it gives you a user time out, all it is saying is that you aborted the connection.

Well I hope this helps.

2318. Boston?

Newsgroup: comp.sys.atari.st
Date: 1996-02-04 00:00:00 UTC
From: fl@ionews.io.org
Message-ID: <4f340m$728@ionews.io.org>
Source record: 151431

I may be moving to Boston in the next month or so, and I was wondering if anyone from there could inform me as to the availability of Atari support in that city. Is there a user's group? Are there Software outlets that carry Atari software and hardware?

Also, what would be a good ISP (Internet Service Provider) for someone using mostly Connect or some other form of Terminal Emulator for Shell access, plus allows a SLIP connection for those times I get STIK/CAB to work.

If you could reply by email, I'd appreciate any help I can get.

Thanks.

>(after spending time figuring out how).
>I prefer to have the files Zip'ed instead though.

Zips don't maintain symbolic links, or creation and access times, and may
mangle the names if you use the wrong unzipper. For unix stuff .tar.gz
is much better, but I would agree that atari stuff ought to be in a .zip or
lzh a they are more common on the atari.

>By the way, why do so many people write 'U**X' instead of 'UNIX'? Is
>UNIX a no-no word? ;-)

Unix is a trademark (although I've lost track of whose it is this week :)

Some people use something like u*ix un*x u**x *ix *nix to refer to one of
the many unix like systems which may or may not be legitimately called
unix.

Take a pill, get a life, buy a clue, etc. Maybe the rules have changed
-- certainly the PC mentality wholeheartedly encourages such thinking --
but the last time I checked, obsolescence does not invalidate the
usefulness of a machine. There are still Atari magazines published -- I
work for one. There is still Atari software being written -- I write
some. Moreover the Atari can still do everything most people want it to.

So. Can a 386 run everything a 486 or Pentium can? For the most part,
yes. The 386 is obsolete. Does that make it any less useful? Slower,
certainly, but the answer is en emphatic NO!

Commodore died more than a year ago, rendering all Amigas obsolete. Did
that render the Amiga instantly useless? No. Does the fact that a new
company owns the rights to Commodore hardware change any of this? No.

And, just FYI -- not that you'd care, of course, in all of your
closed-minded ignorance, but Atari machines are still being manufactured
by third party clone makers.

I normally resist the temptation to reply to the sort of things as
posted by David Frame, it always seems best to ignore insecure people
having a tantrum. In this case though, both myself and my wife thought
it might get taken further so I did.

We were proved right, Mr insecure mailbombed me today with a totally unimaginitive GIF containing the immortal words "You are a wanker" in nice big red letters :-)

There are several misspelled words in the above posting, not to mention mistaken ideas. Anyone who believes in the slightest that he is right, should sell their ST to me really cheaply. I'll use it to introduce newcomers to the world of computing, the easiest and least expensive way, and they can take it from there, using their own imaginations!

2326. CAB list

Newsgroup: comp.sys.atari.st
Date: 1996-02-04 00:00:00 UTC
From: tderrick@acpu.com
Message-ID: <9602040000826708@acpu.com>
Source record: 151439

I have been having severe trouble with my email lately. One of the things that seems to be missing is email from the CAB mail list server. I know that several of you folks are subscribers; has that list gone dead? I know they were having trouble with duplicate messages, although I didn't see any such. Or am I missing a lot? I haven't received anything for almost a week.

If you are among the people who expected me to originate or reply to an email, better re-send and keep doing so until I reply. My local provider still isn't sure that anything is wrong, and I'm pretty sure something is.

hallvart@sn.no (Hallvard Tangeraas) spake thusly:

HT> Doesn't the Mac eject the disk in the drive if you lead it to
HT> the trashcan? If this is so it can be potentially dangerous
HT> for a Mac/ex-Mac user to try out an ST- because he/she will
HT> ofcourse delete the whole disk if this is done!! (unless the
HT> disk is write protected ofcourse). Correct me if I'm wrong-
HT> I've only tried Mac machines a couple of times and seem to
HT> remember this strange (an unlogical) thing about the trashcan.

Absolutely correct. Steve Jobs has been asked about this a few
gazillion times. His answer IIRC is that 'we really couldn't think
of anything else to do that made sense'. Or something like that.

(Does anybody besides me find the 'software eject' feature of the
Mac unnerving? I mean, it is not of the same magnitude as having
your operating system offer to repair a disk that you just copied,
and know is correct. Or having your hard drive start and stop
seemingly at random, or access continuously without being asked.
But still... I'd rather have a button.)

Unless this ST newbie (or his predecessor) has turned off 'confirm
deletes' he shouldn't have any trouble. And no one is allowed to
turn off 'confirm deletes' for the first 3 years of ST use, anyway :)

Hello,

We (New Beat Development) have now released the first playable preview of
our new platform game "Willie - The Adventurer" for the Atari Falcon030.
Featuring parallax scrolling with 64 foreground colours and 4 background
colours, eight channel 8bit/50KHz sound, Jaguar Joypad support and a lot
more.

Check it out! The original archive is named "WP960204.TOS" (self-extracting)
and should be available on both ftp.cnam.fr and ftp.uni-kl.de
as soon as the file are "validated".
Feel free to contact us with bug reports, suggestions, comments or any
other reason. Thank you.

Source record: 151445

On 3 Feb 1996 18:53:27 GMT ,Twas none other than Boris D. Cahan who did state ....

> I am somewhat computer savvy, but have never used
> Unix. When I open TOSWin, and click on open a window, It come up
> with Selectric file selector. In one of the directories
> it found term.000.

find on your minix partition the file "sh" ... should be in either
/bin or /usr/bin and run that from the toswin (using fileslector ..
selectrix is probably not the best to use as IIRC it does not support
long file names ... try freedom or boxkite.

you should get a comand-line prompt in the toswindow ...

play about with the window and size info menus unilt you are happy
then save this as the default toswindow.

now plonk toswin.acc onto the desktop as an icon and everytime you
want to start a shell you click on that. It should automatically start
the shell in the window everytime without fileselector.

BTW don't start toswin as an acc at boot time .. not neccessary with
multitos.

now that is the easy bit .... now you can get on with setting everything
else up ... a good start point is to make sure that you have TERM set to
tw52 and that the entry for tw52 in y our termcap file has the same rows
and columns as you set up your toswindow term options.

oh and make sure you have Warwick Allisons updated toswin ...

TS> advance.:)

If I understand your requirements - check out SoundLab by Damien M. Jones. It will load almost any sample, record from an ST Replay cartridge, edit, and save in lotsa different formats. Works fine on TT, as well as ST. Demo versions are out there. Another useful sound type program is TLC's Player, on the TLC Utilities disk, although recording is not supported. Also 525. Also DSP.prg. Also Anthony Watson's DMASound.

2336. RATSoft support?

Newsgroup: comp.sys.atari.st
Date: 1996-02-04 00:00:00 UTC
From: dpj@delphi.com
Message-ID: <hHHrxwt.dpj@delphi.com>
Source record: 151449

I'm currently running MichTron BBS, _but_ will be switching over to RATSoft very shortly (it's on order). I have a few questions about it and the "local" support.

1. Are there any RATSoft boards that provide good SysOp support in the Northeast (I'm in Boston)? I'll likely be looking for any code that others have done that I might like to see/use.

2. Is RATSoft multi-line? I heard it's in the works - anyone have details?

3. Networking - are there RATSoft boards networking with one another and exchanging mail? What other networking support is there; I heard FidoNET is a possibility?

4. CDROM support? Can I hook up more than one CDROM drive (I'll be running the BBS on a 4-meg Falcon)?

5. Any other suggestions or tips?

TIA

-Dana

In article <4f2pel$j8b@gti.gti.net>,
azog@gti.gti.net (azog) writes:
>I am wondering if it is possible for me to write my own custom GDOS
>printer driver?

GDOS drivers are executable programs, normally written in C. Writing one from scratch would be very difficult. Writing one based on the examples included in Atari's GDOS driver development kit (or whatever they called it) should be fairly easy, but I don't know anyone that has this and the information is probably not freely distributable anyway.

If you use NVDI 3 it comes with generic printer driver that can be made to work with a variety of printers using an ascii configuration file (there's even a GEM based program to edit it for you), although I don't know how flexible this is.

>working properly!

Yes, I agree with all of that! I'm no expert either, but luckily I
have a Unix shell type account so I can access all of these utilities
(after spending time figuring out how).
I prefer to have the files Zip'ed instead though.

As for step by step guides... I've compiled a text file with a lot of
Unix commands which I've learnt along the way and explained them from
a beginner's point of view (like I've been for a long time myself- and
still am in many ways).
It's can be found in the 'Unix' category in my web page (URL below, in
my signature)- it should be easy to find.

By the way, why do so many people write 'U**X' instead of 'UNIX'? Is
UNIX a no-no word? ;-)

So, where can the latest version of Ghostscript be found, and just as
important- how big is the file? (I have an idea we're talking several
100 Kbytes here).

2346. Problems renaming files with 'Selectric'

Newsgroup: comp.sys.atari.st
Date: 1996-02-04 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <3114ffda9f415f3@sn.no>
Source record: 151494

Has anyone had problems using the "Selectric" file selector to rename
several files?

Well, I had to rename a whole bunch of files to a new extension, and
instead of doing this the hard way using the desktop "show" function I
used the "info" function in Selectric after having selected all the
files with that certain extension.

What happened a few times actually was that the whole machine bombed
after 6 or 7 renames. The otehr thing that happened and I found a
little strange was that Selectric went back into the usual
fileselector "menu" instead of going to the next filename.. Strange.

Has anyone experienced anything like this before?
It might have something to do with my setup, but I did a reset twice
since I really had to when the system bombed.
By the way, my system is a 2MB STE with TOS 2.06.

From: rarozijn@xs4all.nl
Message-ID: <3114bf5e3edae0@xs4all.nl>
Source record: 151496

Hi everyone,

I'm trying to use WWW 1.05, but I'm stuck.
I have managed to get through the installation of Stik, or at least I think so. The only problem seems to be that though I have a 14k4 modem, Stik seems to insist on 9600 BPS.
Anyway, once Stik has (I think) properly connected to XS4ALL, the dialog box dissapears, and I have no prompt or anything. If I then start up HTML.PRG, it tells me that Stik is not loaded. ?
If then I try the socalled Hotlist, it seems to try to find something on my harddisk, which ofcourse is not there, and then tells me an error has occured.
If I start up IRC.TOS, GEM dissapears, IRC gives me an option, and when trying the defaults nothing happens and all I can do is reset.

So, can anyone help this newbie trying this graphical (it i's' graphical, isn't it?) browswer?

Thanks,

Sander.

2350. TT-Touch and Mega ST

Newsgroup: comp.sys.atari.st
Date: 1996-02-04 00:00:00 UTC
From: diehl@io.org
Message-ID: <4f385e$3lg@ionews.io.org>
Source record: 151498
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I seem to have run into a problem.

A while back I bought a set of TT-Touch keyboard "nipples" as my current Mega ST keyboard is dying due, I'm certian, to the current keysprings becoming askew inside the keyboard. I brought them home, opened up the keyboard and -- to my great discontent, discovered that there's no way to get at the keysprings.

The keyboard has an etched serial number on the top metal faceplate of C 100062-001, but below the directional keypad is a sticker with a different serial number: CA200043-001. The keyboard itself has a black metal faceplate below the keys, and the keys themselves appear to go through this faceplate to a daughterboard below, where they're soldered in place -- plastic key casing and all. I can't remove the indiviidual keys themselevs without desoldering each one individually, and even tthen I'm not sure that I could get the keys open in the first place, as the casing, while seeming to be of a two-piece, separatable design, doesn't seem to be able to come apart. Each key has what looks like a tiny plastic catch -- at first I thought that this was what was holding them in place, but upon trying to pry one out I noticed that the motherboard beneath was rising as I pried, which indicated to me that they are soldered, or at least more or less permanently fastened to it.

Is there any way to get at these keys? If not, would anyone happen to have a spare working Mega ST keyboard lying about they'd care to part with? (Either the whole keyboard unit [with or without cable] or just the bare keyboard -- I think it's a 16-pin connector)

Any help would be greatly appreciated.

Most people who got a look at my ST over the years were impressed with GEM. DRI did a very nice job with this GUI. GEM actually appeared on the market for the PC. I don't know what percentage of the market it shared with the other GUI's.

Atari's initial ST offering (Motorola/TOS/GEM) was really nice. Atari did not do a good job marketing their machines. Hope that GEM or something as intuitive captures some of the market share from Windoz.

Remember, Microsoft let Windoz flounder in committee while Gates waited to see how Xerox's lawsuit aqainst Apple would come out (40 million in 1991?). Windoz early release was a case of major alterations that left Windoz looking like a piece of crap. (And, don't forget that Intel's attitude all along was, "Who cares if the processor's design is flawed, it works don't it!"

Dont' forget .. Atari is "Out of the computer business!" and "Most of the people who use or used Atari's are a dynamic lot always looking for the cutting edge in computers!" So, moving on to the next crop of "tech" is a very natural process for us.

: : Just download it !!!! It lies virtually everywhere.
: : I cannot contemplate why people keep complaining that they miss things,
: : that really exist for quite some time now. Get MiNT, MiNTnet, WWW116
: : and cab-for-mintnet164.tar.gz and you'll have an excellent web browser
: : that connects via SLIP, CSLIP, PPP or even Ethernet.

: I can download CAB and STiK and unzip them and have them running in 30
: minutes, or I can download 15 programs that I can't get to unpack 'cuz
: they are tarred and gnuzipped and neither TAR.TTP nor GNUZIP works for
: me, I can set up MiNT (and I think there are many who can't even do
: that), and probably MiNT-Net, but it is all a MESS.

: I WISH someone would zip or lzh these things, so much easier to unpack.

Unfortunately there are no MiNT friendly versions of these packers.
Besides tar & gzip packs better + tar has multivolume option which
isn't on any other atari archivers.

Without MiNT you'll have to run tar and gzip separately:

```
gzip -d file
tar -xvf file
```

You can for example install you desktop program to execute these
automatically when you click on files ending with 'gz', 'tgz' or 'tar'.

With MiNT you can say just:

```
tar -zxvf file
```

(assuming gzip is on a directory mentioned on PATH enviroment variable)

: I refuse to run Minix and reformat a partition of my already too smal
: hard drive.

Not necessary.

: It should be possible to make a fairly simple to install
: set-up that idiots like me could figure out how to set-up.

MiNTNet offers much more features than STiK -> it needs more setting
up for a particular setup. Things that you'll need for MiNTNet to
work:

- MiNT v1.12 or better
- MiNTNet configuration file mint.cnf
- MiNTNet sockdev.xdd
- MiNTNet drivers *.xif (one for each protocol)
- Some configuration files on /etc directory

(linked to some directory on your TOS drive on mint.cnf)
which tell the net programs which is your address, where
is nameserver etc.
- ifconfig and slattach utils from MiNTNet package
- Applications like ncftp, CAB+MiNTNet-OVL etc.

- Eero

:
: > > Have fun, MiNT is a great piece of software.
:
:
: > But does it run at acceptable speed on a 16 MHz Mega STe?
:
: MiNT has a very minimal if any effect on system speed ... running loads of sessions ,
: mulitple logins and virtual consoles of course will :-))

I have to disagree here.

I'm running Freemint-1.12.4 and Minix 0.610b, and ls of a directory with,
for example, 20 files in, takes a few seconds.

An ls should be instantaneous, no matter how many files reside in the
directory.

The above speed doesn't occur only when I'm running lots of processes. If I
only have Mint and Tcsh running, the ls still takes this long. I have only
2MB of memory, but this shouldn't affect the time either.

Now don't get me wrong, Mint on a 8mhz STE is fun, but not particularly
useable.

I just finally got Init working, albeit with a few errors, like a weird one
which happens every so often when it doesn't find /pipe/log; why it would
want a log in the pipe directory puzzles me.

2359. Prg/Cpx to clear modem buffer?

Newsgroup: comp.sys.atari.st
Date: 1996-02-05 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <31165fa6c687d24@sn.no>
Source record: 151307

Is there some sort of program or CPX module around which clears the modem buffer?

I think this is the problem I'm having after having used my sequencer program "Notator" and then try to use "Connect" and log into a BBS or my Internet provider's machine.

The computer communicates perfectly with my modem (I've tried sending various AT commands and it does what I tell it to do), but I get no feedback on the screen!

The only way to resolve the problem is to reset the machine, which is a bit irritating, since I have to do this every time after I've used "Notator", so is there some kind of program or CPX module (preffered) which fixes this problem?

Hallvard

Hello! I have the for following items for sale, shipping is additional:

ATARI hardware/software for sale:

GENEVA and Neodesk.....Best offer
FirstGraph presentation software.....best offer
Diamond Edge.....best offer
Diamond Back II.....best offer
STalker 3.....best offer
Warp 9 v3.7.....best offer
MacSee.....best offer
MaxiFile from CodeHead.....best offer
Mini Office (Nicely done graphs and stuff, from UK) .....$25.
Learn to Read with Prof...ages 4 to 9.....$5
General Store with Bentley Bear, grades 4-7 .....$5
Mixed-up Mother Goose...ages 4 and up.....$5
Atari 1040 ST with DS/DD drive, color monitor, lots of programs
included.....$100

MAC software and hardware:

Quark XPress 3.31r5, 68k, non registerable, manuals, disks, box, etc.
COMPLETE $250

Adobe ILLUSTRATOR 5.5 upgrade disks only, no manual $50

Backmatic 2.0 highly rated automatic backup utility $5

Aldus Freehand 1.0- use for cheap upgrade! $25

Correct Grammar 3.2, $20

Expresso Calendar, $20

Quicken 4, $15

Grolier Multimedia Encyclopedia 4.0 $20

Intermail/ Microsoft mail 1.36. many users. $5 includes shipping

Rental Center helper software and disks and big manual $5 includes shipping

PageMaker 4.0, manuals, disks, box, etc. use for cheap upgrade- COMPLETE $100

CD-ROM drive and software, double speed, "Power User brand" complete with
all materials and software... good as new... $100

Car Stereo items for sale:
All items are used but in working condition. No, They are not stolen, I

just went through a phase where I liked installing and swapping around the stuff. Life's too busy to mess with it now. My lack of free time is your Big Audio Bonanza. And no, I'm not a dealer.
Some items have boxes and/or instruction books.

Car Stereo:
Mitsubishi RX791EM AM/FM High Power auto reverse cassette deck I don't know the power output other than it says "high power" on the front and it was always plenty loud for my rock and roll. There is a color code table for all the wires and connectors so you'll know what goes where. All parts are there, faceplate, knobs, etc. and it is the two-knob kind (not DIN) with an analog tuner, pushbutton presets, auto reverse, Dolby, and "NK" noise killer. All in all a pretty good deck. $make offer

Car Stereo AMPS:
Craig PowerPlay 48 watt amp $make offer
Concord HPA51 100 watt amp $make offer

Car Stereo extra special stuff:
Yamaha YEC-400 Electronic Crossover $make offer

Car Stereo Speakers:
Sony ES-S52 40 watt Coaxial 5.25 inch round speakers with grilles $make offer
Kenwood KFC-162 25 watt Coaxial 5.25 inch round speakers with grilles $make offer
Craig V203 10 watt Coaxial 5.25 inch round speakers with grilles $make offer

Car ALARMS:
Cliffalarm IMS (interior monitoring system) made by Clifford. Remote operation from fairly far away. Siren chirps when alarm is set or unset. Visible flashing LED in the car warns theives that the car is alarm protected. LED on the remote tells you remote is working fine. Panic alarm feature sounds the alarm if you hold down the remote button for 2 or 3 seconds. Shock and motion sensor is sensitive to breaking glass, but not to leaves dropping or cars passing by. Door triggers. Automatic reset after predetermined time to protection mode.
$25

Audiovox car alarm *BRAND NEW IN BOX* Model AA9147 with 2 remote transmitters, remote panic, built-in adjustable shock sensor, instant-on for hood and trunk, manual override, dash mounted status condition LED, active operation, 114db siren, starter disable
$50

Home stereo stuff:
DBX NX-40 Tape noise eliminator and disc decoder. Much better than Dolby.
$make offer

CAMERA stuff:
Hasselblad view screen for 500CM:
Plain screen #42200- $20

Zeiss Ikon/ Contaflex 35mm camera marked "(lightning flash symbol) matic" on the top, and Contaflex on the 50mm 2.8 Zeiss lens, Compur-x leaf shutter. Lens is "convertable" variety, switchable from 50mm to 35mm by changing the front elements, although I only have the 50mm lens element. Built in meter, and even a rudimentary "auto" mode. With case. I'd call it very good condition... no dings or dents, the textured black covering is perfect, the chrome is perfect, and the black finish is perfect. Optically, perfect. The only rough areas are the battery compartment has a little corrosion on the inside and a little brassing on the outside. A "ready-case" is included but the leather is torn where the front connects to the back of the case. Surely a collectors item- $150

Metz SCA-351 adapter for Leica $25

I'm not certain if this will help, but on most atari keyboards you need
to remove all the tiny screws from the plasit back panel of the keyboard.
This will allow you access to the internal workings. I've never torn a
Mega keyboard apart though so it may be different.

Contact his system administrator. His actions are a breach of internet protocol. I know some people hear about all the flame wars on the internet via TV, Radio, Print etc., and can't wait to try it out. But it still doesn't make it acceptable behavior. In fact there have been cases in the U.S. where universities have threatened legal action against such people.

Personally whenever I get email of this genre I do the following:

1. Forward it directly back to them.

2. Forward a copy to their system administrator asking them what they plan on doing about this user.

In the past when sinclap would bounce into here with his trash we would follow the above method. Then amazingly enough within a few days he would disappear for a few months (I imagine his probation period). Sys admins at commercial sites are generally somewhat more tolerant than universities or businesses but even they respond when they get dozens of messages a day complaining about one of their customers. It's not worth the hassle for them and it's not worth the cost to the internet community in general to pay for the cost (minimal as it may be) for broadcasting this type of junk over the entire planet.

2366. WANTED: Supra Drive Utilities/Documentation

Newsgroup: comp.sys.atari.st
Date: 1996-02-05 00:00:00 UTC
From: Tom Duffey <thomas_duffey@ple.af.mil>
Message-ID: <4f5f27$efu@fg1.plk.af.mil>
Source record: 151314

Does anyone have a copy of the Supra drive utilities that I can beg, borrow or steal? I bought a 20MB shoe box unit from a guy who posted in this newsgroup and it didn't come with any documentation or disks. Can I use the Atari HDX 5.04 utilities to reformat and or repartion this drive. The drive is partitioned into two 10MB partitions and I would rather have a single 20MB partition. Any help would be greatly appreciated!

You may resond to my e-mail address or this newsgroup.

Thanks

>Cheers.....David G.

I subscribed to AW from issue 2 onwards, by mistake they added me to the 'with disk' list, but I have been so pleased with the disks so far, only one dodgy/blank one so far, and only one other where the content wasn't of much use to ME. Invariably, Joe Connor does a great job of getting varied, interesting and useful stuff together. For the extra few quid a quarter it costs, I think it excellent value overall.

As for UDO, can't quite think of a use for it myself, but certainly looks impressive.

>expensive.

I can't agree with you there- IDE interfaces are available for the ST
for around 50 pounds. Unfortunately I haven't located any for the STe,
but there are interfaces available for the ST/F/M machines.

I think in most cases you can tap the power for the harddisk from the
ST's power supply, so there's another saving.
If the drive is a 2.5" type ('laptop' type harddisk) you can even
install the harddisk *inside* the ST!

The drawback (well, not really) is that you need TOS 2.06 in order to
boot from an IDE harddisk, but you can ofcourse boot from a floppy
disk and then upgrade the TOS later. In my opinion TOS 2.06 is almost
essential if you're serious about your computer, so you'll be well
off upgrading anyway.

And with ST/F/M machines you'll need a TOS board anyway to upgrade-
with the IDE board you get this TOS board and an IDE interface all
rolled into one!
So, I wouldn't say they're very expensive compared to an SCSI adaptor,
external power supply and case which you'd need in addition to the
harddisk itself if you'd want to go for SCSI.

For immediate release:

PROWLER

"The Atari Console Disk Magazine"

Worcs, UK, 3/02/96 --- Announcing Prowler, a new PD disk magazine featuring
all aspects of Atari games consoles including Jaguar, Lynx and 8 bits.

The magazine will be released bi-monthly via Internet, bulletin boards and PD libraries and will be compiled in HTML format to allow for greater ease of use, better presentation, screenshots and cross platform compatibility. An HTML compatible reader will be supplied with the magazine to ensure that you can access the magazine with the maximum of ease.

Between each issue the internet will be dredged for all important information relating to Atari consoles. This will include the latest news from the gaming industry and press releases direct from Atari themselves, reviews and previews from experts in the field, cheats and tips, and ideas for hardware modifications to ensure that you use your Atari games console to its full potential.

What we need is *YOUR* input! We would be greatful for any of the following:

- reviews of games, including ratings out of ten for each aspect of the game such as sound, graphics, playability etc.

- cheats and tips.

- hardware modifications that you have experimented with and found to work.

- requests for help.

- views on the future of the Atari console scene.

- address's and telephone numbers of shops that stock Atari games consoles and/or games for Atari consoles.

- items wanted and items for sale which relate to Atari games consoles.

- show reports.

- letters.

- anything else that you feel a like minded Atari console enthusiast would be interested in.

It would be appreciated if any material sent is in ASCII format, but printed documents will also be accepted.

Address's for material to be sent follow:

>SHIT, OLD, ARKANE, DECREPID, RUBBISH MACHINE UNTIL NOW!!!! THE ST DIED
>AGES AGO!

You obviously have a very sad bunch of mates that can find one
machine based on 80's arcitecture funny and one not, epecially when
the older and cheaper one can do pretty much the same as the other for
about 256f the price. The only thing that's crap about my ST is the
lack of games and i've got a PSX for that. You don't need a 1000+ pound
machine to use the internet and type a few letters out and that's all I
really want to do, so does it make me stupid or you?
What exactly is a dead machine? A one with no users and you just
admitted there are loads of us so we 'aint dead. If you don't like it
don't use it but don't try to insult people that don't fall for some
crappy hype about PC's being so fantastic, after being asked to sort
out 3 of my mates PC's autoexec.bat & config.sys files this christmas,
I can assure you that thats a whole lot of hastle I can do without.
Oh and who needs their head read-Someone insulting a machine that they
lost a long time and going around reading newsgroups about machines
that they think are owned by stupid people or the people who invest
their cash in a machine, like it and stick with it? If your PC can do
so many fantastic things then get out there and try and overcome your
640k base ram limit.

>Andrew
I assume you want your "end-user" to print or place the file in a document and that's why you don't print it yourself. If you could tell us the format that the file is needed in by the people doing the magazine that would help. :^)
I am NOT very knowledgable about PageStream, but can you not export a page as a Postscript(*.eps) file? or print to file using a postscript driver (which creates a postscript file)? File size may not be much smaller though as I've noticed postscript files can get huge.(quite)

I think you have something wrong :-)
Stik is a tcp/ip stack not just a modem dialer it does all of the
resloving of internet addresses and recives data via tcp/ip protocol
which Flash II or any other comms package does not support.
It would be impossible to make cab use a normal comms package to get
the data it needs.

>STiK should have some sort of viable interface that allows for a DO File
>type of configuration. Most ATARI programs these days are student
>projects being done for CS credit at various institutions of higher

>their code once they have gotten their grade!

I dont think thats true most CS students doing projects for their
degree's etc will probably use the machines installed at the
university which will probably be some sort of unix and xwindows
platform I do know of a few people who have made programs for their
end of year projects on their atari's but this has usually been under
linux or they code it then port it to something available at the
university. IMHO most programs which do get developed past the
beta stage are programs that the authors will continue to use for a
long time they then have more incentive to improve there product and
to fix bugs etc most CS projects are as you say just to get people
through the course and will be dumped away somewhere after they have
been marked and demonstrated. This is not always the case though.

>Some use the basic concept as a platform to get them thru several terms
>and hense, the result being increasingly sophisticated pd versions. The

2384. What exactly is a CGI?

Newsgroup: comp.sys.atari.st
Date: 1996-02-05 00:00:00 UTC
From: Aaron Barnes <barnes@network.sos.on.ca>
Message-ID: <Pine.LNX.3.91.960205191506.16436B-100000@network.sos.on.ca>
Source record: 151332

My subject pretty much says it all really, I've started designing
web pages and I was wondering what exactly a CGI is, how to write them,
whether they need to be compiled, and how compatible they are with
different web browsers. I realize this post may be better suited to
another Newsgroup, but since I'm designing on an atari and would like my
pages to work well with cab I thought this would be the best place.

P.S. speaking of cab, is there a more recent version existing
than the one on ftp.toad.net? (cab.zip)

P.P.S. On my web page, I am attempting to keep the latest
downloadable STiK software for the ST, including STiK, CAB, Telnet,
Forecast, the swampdog utilities, and anything else that comes out..
(personally, I'm praying for a good e-mail program but.....)

The log itself isn't in the pipe directory. Under MiNT named pipes have to be
in the /pipe directory (where on unix they can be anywhere but normally in
/tmp). So in order for error messages to be piped to syslogd there has to be
a pipe in /pipe. The error normally means you don't have syslogd running.

>Right now I start off with Tiny Term (so I can use XYZ.ttp) then run

Storm is quite capable of running XYZ.TTP itself, in fact Storm's basic
is a powerhouse. I have a downloading script that always wows my Procom
and Zterm friends who use same Unix shell as me. I can list file names
in my home directory with "ls -1", highlight the file names with the cursor,
copy them from the little pop-up (they go to CLIPBRD\SCRAP.TXT) and then
with 1 keypress the file-names are reloaded and passed (one at a time) to
XYZ.TTP which is executed. Then the files are deleted from my Unix directory.

Up to 30 files with a few mouseclicks and a keypress, I love it!

I have other Atari St Software for sale. All are original
programs plus documentation. No box unless noted.
I will sell for the price listed plus $3.00 shipping in the
USA. If you get more than one program you only have to pay
$3.00 shipping once.

1. U.M.S. Universal Military Simulator plus once scenery
disk (the civil war) 12.00

2. Timeworks Publisher ST with box 12.00

3. Codename Iceman from Sierra--never opened
box still in wrap 12.00

4. dungeon Master I 10.00

5. Dungeon Master II chaos strikes back 10.00

6. Degas Art program 10.00

7. Leader Board Golf plus tournament disk I
plus the key 10.00

8. Sundog (great game) 10.00

9. Printmaster and Art Gallery I (more graphics) 10.00

feel free to make an offer if you wish to buy more than
one program..no reasonable offer will be refused
thanks Robert Oyler usa, illinois
royler@cnmnet.com

This is my $5.00 list of Atari St software.
I will sell any program on this list for $5.00 plus
$3.00 shipping for the first program, then no shipping
charges for any additional programs for any of my 4 lists.
All are original programs with documentation but no boxes
unless noted. If you wish to buy lots of programs, please
make an offer, no reasonable offer will be refused.
Its easier for me to ship to one place, then all over the
U.S.A. but if there is that one program you only want I will
be glad to help out. Thanks Robert Oyler royler@cnmnet.com
U.S.A. Illinois

$5.00 programs
1. 8-ball--Michtron
2. Michtron B.B.S. (have box)
3. Stalker Modem program
4. Stealth Modem Program
5. Mini office pro--data base with box 5.00
6. Superman
7. cosmic pirate
8. the magic Fly
9. Seconds Out boxing
10. Karate Kid II
11. Rambo III
12. Clive Barkers Nightbreed
13. Time
14. First Paint
15. golden Path (have 2 copies available)

thanks again for reading all of this
if took a few minutes to type it all out...

2390. CAB (STiK/MiNT Net) Survey

Newsgroup: comp.sys.atari.st
Date: 1996-02-05 00:00:00 UTC
From: ackerman.29@postbox.acs.ohio-state.edu
Message-ID: <ackerman.29-0502961602440001@gb107samac.acs.ohio-state.edu>
Source record: 151338

Hello I'm trying to figure something out, so if you kind CAB users out there could answer this quick survey it would be very helpful.

1. Which program(s) do you use to connect to the net with CAB?

a. STiK
b. MintNet

2. What TOS/OS do you use?

a. Normal Tos (Please add version)

b. Multi Tos (Please add version + AES version)

c. Mint (Please add version)

d. Magic (pav)

e. Geneva (pav)

f. Other (please identify)

3. How often does CAB crash on you?

a. you mean it actually runs ;)

b. often

c. rarely

d. once or twice

e. never

4. If using MiNT or MultiTOS, which CAB.OVL do you use?

a. Dancer's MiNT Net

b. Newsome's STiK

Thank you for your time,

Dan Ackerman
aka baldrick@terminator.rs.itd.umich.edu

Just use the search and replace in just about every WP/Text editor to
do a serch and replace (search for %(1 percent sign) and replace with
%%(2 percent signs)... and only do it on stuff you KNOW is going to
get corrupted !!

BTW: it'll be interesting to see how the above comes out (as I typed
an extra percent sign in both cases !)...

You could try gemview in batch conversion mode. Translate into another format and then back again
and see if you get better compression.
>...
>
> I once did the same thing except I printed as a PostScript file. The single

Source record: 151361

I don't know why the unbatch bombs out, but it is easy enough to get round after the fact. Watch carefully to see when it is bombing. It bombs out during the message _after_ the problem one. So all you have to do is load the batch file into a text editor & delete all messages up to and including the problem one. Not elegant, but more cost-effective than reloading all your news!

: 2. CAB reports can find 00000001.htm. Take out a text editor and
: create one. It doesn't need to have anything in it. Just open a new file
: and save it out to your cache directory under the appropriate name. (I
: can't remember if the above one is correct, however.)

I've had this problem when I ran CAB before enabling STiK. If STiK is
enabled and connected before running CAB, this problem should go away.

Also, I'm still getting "run-time error 164" messages ($005C03E), but it
seems to be much better after I enlarged the caches. Could this have
something to do with disk access during caching?

Hmmmm.. I was hoping I was wrong.., so how do you delete files/a whole
disk on a Mac then?

I guess we can say that the ST most have the world's most intuitive
system instead of the Mac or any other system (perhaps).

>(Humble voice) Serves you right for using Oasis to read your news !
>Use AtariNOS and you won't get shortened messages when they exceed
>the length stated in the 'Lines' line in the header.

Ah, well, they don't actually exceed the stated length. "Lines" says how many lines are in the message body, which doesn't include the blank line between header and body (RFC 1036). Oasis mistakenly counts the blank line as part of the body, and users often won't notice the missing line because it would just be part of the signature.

I think this article may well have an incorrect (i.e. +1) "Lines" value attached to it, but that's because mail2news@news.demon.co.uk has tampered with it. Tsk.

<raving looney posting deleted>

oh dear, after several months of peace after the departure of
Roger the Sad Sheppard, the sewers are backing up again.......

this is coming from a very pleased Atari Falcon user who has
been getting a LOT of use from his setup - and yet does not feel as
insecure as the above sad anorak who feels he has to come into this
forum and try to justify his purchase of a competing brand of
computer by claiming we're all idiots for using Atari/TOS computers.
Maybe if he stepped away from his computer screen and took a few
walks out in the street, and found himself a girlfriend, he'd maybe
calm down.

These are COMPUTERS we're using. Not toys. These are the tools
we prefer to use for their ease of use, excellent features,
continuing support by third-party developers in spite of being
dropped by the Tramiels (which is a blessing when you think of it),
and best of all, relatively free of the snake-oil and grandiose
pie-in-the-sky thinking that Mr. Bi66 6ates wishes to force on us as
the ONLY choice

To the above poster, I'd like to say this........

2405. NVRAM settings using Boot Config v1.2

Newsgroup: comp.sys.atari.st
Date: 1996-02-05 00:00:00 UTC
From: molin@cxc1.cl.msu.edu
Message-ID: <4f46pl$f7a@cxc1.cl.msu.edu>
Source record: 151370

I found that Boot Config does a nice job of setting my Falcon's NVRAM
defaults (other than it can't seem to decipher my keyboard country code...)
However I'm curious about some of the settings, and since everything
from docs to prompts are in German, I was hoping some kind German/English
bi-linguist could translate the following test. (I'm particularly
interested in the portion which describes 'Bootverzvgerung' and also
the SCSI Arbitration settings.)

Thanx!

BOOTCONF ermvglicht das Konfigurieren der Bootparameter von TT und Falcon030,
wie sie im nicht fl|chtigen RAM (NVM) abgelegt sind. Ndheres hierzu siehe
ST Computer 2/92.
Diese Einstellungen werden nach dem Einschalten oder einem Reset aktiviert.
Die Videoparameter werden beim Laden der NEWDESK.INF-Datei allerdings wieder
|berschrieben. Wird die Bootverzvgerung auf weniger als 8 s eingestellt, f|hrt
der Falcon keinen Speichertest durch, sondern bootet automatisch, sobald die
Festplatte bereit ist.
Beim TT sind nur die Angaben f|r die Bootprdferenz und die SCSI-ID von
Bedeutung. Die SCSI-ID wird nur dann ausgewertet, wenn ein Festplattentreiber
verwendet wird, der Bus Arbitration unterst|tzt, z. B. HDDRIVER ab
Version 3.5.

: Somebody here may correct me, but I don't think you will be able to
: read your DOS disk on the Atari.

That is correct. MS-DOS and AHDI format the disks differently, so you will have to reformat the disk for the Atari. If there is information on the disk that you are looking to transfer, you are currently better off transferring those files via a direct null modem serial connection and a couple of terminal programs.

It is possible that someone has written a program that can read MS-DOS partitions on a SCSI drive and extract files. I haven't seen one yet, but it could be a useful utility. Any takers?

> I've just saved a Pagestream page to disk as an IMG file and it's come out at a
> whopping 3.3 MB. What on earth can I do with this, even on a 4MB STe?

Let's see: if your page was 10x8 and you printed with a resolution of
300 dpi , that's 10x8x300x300 = 7200000 pixels. Assuming monochrome
(1 bit per pixel) the raw image amounts to 900000 bytes. So your IMG
does indeed seem a bit on the large side.
> I'd
> like to convert the IMG to a more compact filesize, ideally a TIF or GIF
> file. I've never saved to disk like this before, so any ideas are welcome.

Actually IMG files *can* be quite compact, but it is said that many
programs use the format very inefficiently: maybe Pagestream is one.
In that case converting to GIF should do the trick: try GEMview
(shareware) or ImageCopy (commercial, but cheap).

OTOH if your page was in glorious colour then maybe it really *is*
that big. In that case you need to be looking for an archiving program
used on both STs and whatever your publisher uses, or maybe you can use
SPLITT (exists for STs and PCs at least).

> The only idea I have is to reduce filesize by reducing resolution, yet I'm

Both of the converters I mentioned *should* work, but I confess I've
never tried them on anything quite as big as 3.3 MB.

Hi Andrew,
Any bit map file is going to be big, bit 3Mb is _really_ big!
Try sending it as an eps file. Load the Postscipt driver, configure for disk
file output, and put [eps] (lower case, minus the brackets) in the special
instructions line. Name your file 'myfile.eps' and voila!

Test it by reloading it into PGS (you will get a crossed box, this is OK), or
by sending to a PS printer.

Most bureaux will be able to import eps files...

Hope this helps.

Well, I don't know what's the situation in the states, but in Europe
(especially
in France and Deutschland), Atari computers are still used in a number of way.
I own an Atari Falcon and, too, a pentium 90.I spend 80 % of my time on my
Falcon, sorry, coz I'm coding, and for this, pc's are just a big bunch of s..t.
You have the power (in the processor) but themachine design is so crappy that
you can't use half of it.
Let's take some examples:
-Please give me a game on pc that run at 60 fps on a 486/dx2 66 (supposed 32
times as fast as a ste, that can do it easily). Nope.
-To make digital music, Falcon is the best.To have 8 16 bits channels in dma,
with a 56001 dsp and a professionnal sound on pc, you could buy a card, for
sure. It exists. 7000 dollars. And I won't talk of the troublesettings...

-The Falcon system is excellent(i prefere it to the Macintosh), multitasking,
and efficient. Try running Window 95 on a 386 sx 16, just to laugh...

To end i'll say one thing : please first learn coding on different machines.
Then you'll have a different point of view on computers.

ognibene@eea.unice.fr

Hi everybody! As I've seen strange (and probably PC owner) message in this newsgroup, I want to say something more positive:
I LOVE MY ATARI and i wouldn't sell it for anything. It's a great machine, easy to use, very versatile. One would say it's too slow : buy an accelerator board. And take a look at window 95 on a 386 sx 16. I've tryed. I laughed a lot :-)
One would say: there are no softs.It's not true. I know that in the States you don't have all the great stuff that we have in Europe (like Papyrus, ..)
New programs are coming every month.

I could give much more examples, but my english is not good enough...

Keep Atari'ing!

:board. And take a look at window 95 on a 386 sx 16. I've tryed. I laughed a
:lot :-)

not a fair comparison, win95 is written for 486/pentium. 386sx/16 is a
very very old machine. IF you want to compare (one shouldn't though)
compare a falcon to a pc that costs about the same, so compare a falcon
to a high-end 486.

Anyway, I LOVE my ST! but I know it is a lot slower than pc's but thats
besides the point. My ST gives me things other than speed...

:you don't have all the great stuff that we have in Europe (like Papyrus, ..)
:New programs are coming every month.

All I need on my ST is a C compiler...

|> for the space to the base 12 chars.

That's actually <number>*16 - 2 (two bytes for storing the inode
number). You should only use 1, 2, or 4 for the <number>.

>seen any spec for the (soon to be released ;-)) 68060 from Motorola.

No, sorry.
Most computers are Intel based DOS/WINDOWS and perhaps OS/2 systems and many owners do not even know that there is something like ATARI or compatibles. So, if you want to sell a ATARI (compatible) computer you cannot go to firm and say "Sorry, you can't run WINDOWS and you can't run your nice programm, but no problem, you can get every type of software you want for this computer....."
The only good solution is to build a computer which is able to run both, PC stuff AND ATARI stuff and later perhaps APPLE stuff. Then you can go to firms and say "Ok, run Windows, run MAC-OS. But take a look at the great ATARI software and the price of it."
With a computer like this you maybe can save the ATARI (maybe not the original firm, but the market).
So I think, the only way is to build a working multi-plattform computer with a very good OS (Linux with X ?) which gives the possibility to run emulate other computers (the big difference between many computers is the memory location of the hardware). Then put in a standard expansion system (PCI ?) and a standard memory (SIMM). Put in some good developed subsystems (SCSI, EIDE, sound with DSPs, seriell ports, parallel ports, joystick ports, MIDI, ethernet) and sell this computer in a standard PC tower case.

So, if there are people left, who want to think about a new computer like this, feel free to answer.

So long,
Michael Guse

You're absolutely right. My brain cell (cells?) played tricks with me.
I was confusing it with the path I use when adding files to the
archive.
(hmmmm... maybe I should stop having these nightly online sessions) ;-)

So, the correct path like you told me worked is:

ftp.sn.no /user/hallvart/atari/

I'll be adding more files to the archive soon and hopefully get the
links from my Atari section on my web page done as well.
(you can get there from the Atari section now, but I'm working on
having links with explanations about the various programs for people
who are just starting out etc.)

>OUT YEARS AGO!

Poor deluded soul, but imagine his frustration. Every time he thinks of something good to do with his PC, it crashes! I use one for work and if it doesn't crash/lockup at least one a day it's been a good day. Often by the end of the day I feel like taking it out on someone, if only that 'grinning geek' Bill Gates was within arms reach.
Then after being intimidated into purchasing a PC, his friends (!) are probable laughing at him again as it now (3 weeks later) out of date and can't run the latest software. The only way to make himself feel better is to have a go at us Atarians, so humour the kid ... its no skin of our noses ;-) Just think he spent lots of money to purchase a PC to 'play crappy games with lovely gouraud shading' when he could have bought a Jag, Playstation or Saturn for a fraction of the price.

Me, I'm happy with my ST and spending the money saved on the rich tapestry of life (wine, women and song)

Live life and be happy ...:-)

Andy.

There is such a program on atari.archive in Graphics/squeezim.zoo IIRC, it
may have problems loading such a large file into memory though.

Worse still, if you are a Demon user, you will be removed from the
CAB mailing list altogether - something to do with Demon's overloaded
mail machines causing the list organiser's machine all sorts of problems.

Sounds to me, though, that the problem is more at the list organiser's end
what with all the duplicated messages &c. !

#>Hey does the internal IDE drive on the Falc have to be the boot drive? Mine is fla-ky...getting an external SCSI drive, it can be a boot drive right?
#>Quick response? Thanks!
There are two possibilities:
1) Remove your IDE drive, connect an SCSI HD and install a driver on it. This has the disadvantage that an unpatched TOS will wait for about 30 seconds if it doesn't get a response from an IDE drive.
2) Connect the SCSI HD, un-install the driver from the IDE drive an install it on the SCSI HD. This way, TOS will find the IDE drive on bootup, but will notice that the rootsector is not executable, so it will continue and try to boot from an SCSI device.

Ciao

TG> Subject: Hard Drive
TG> for my 1040 I would like to get a hard drive for my Old Atari
TG> 1040 ST. I would like to know if I could get a generic hard
TG> drive (for a PC or something) and modify it to work with the
TG> 1040. If anyone knows info on this topic, I would appreciate
TG> if you could get back to me.

You cannot use an IDE drive with your ST, but any SCSI drive should work. You will need a 'host adaptor', such as The Link II, to connect from your ST's DMA port to the hard drive.

What are you going to store in this drive? Do you need a *lot* of room, for picture or sound files, or will it mostly be programs and data files? There are almost always a few 30M - 100M hard drives with host adaptor and box with power supply available for sale in this newsgroup for quite reasonable prices (~$100US). The Link II is selling at retail for ~$90US, so buying a complete used hard drive sub-system might be an attractive option for you.

"The Poor Deluded Soul" - tderrick@acpu.com

You could try 'Probe House Expense Manager'

AFAIK its the latest and probably best non-commercial, accounts
package. Try Hensa for a copy (It was on an STF coverdisk).

So, you've finally realised why people buy PCs and Amigas. To play games.

Meanwhile, those of us with work to do, carry on doing so with our Ataris,
Macs, BeBoxes, Alphas ...

And we get a lot more done in shorter time frames than other
pseudo "serious" hardware.

hbact182@csun.edu (tejinder gill) spake thusly:

TG> I have been deciding whether or not I will continue using my
TG> 1040ST as my main computer. I have been primarily been using
TG> it for music sequencing but now I would like to see if I can
TG> get more out of it. I often read this group and so I know
TG> what the machine is capable of to some degree. I already have
TG> a pretty good Database app for it and it serves my purpose
TG> well. What are some of the good word processors that are
TG> still available. Do they compare to Microsoft Word for the PC?

I am told that Papyrus does. Personally, for any *serious*
presentations, I will probably stay with PageSTream; it is pretty
useless for text entry, but that is what text editors are for. The
general trend (for several years now) is to blur the distinctions
between DTP and Word Processing; that is what MS Word, WordPerfect,
and their competitors do. And for many people, that is the best way
to go. But a text editor/DTP combo, well learned, provides more
flexibility. The WordPerfect types that my wife works with are
astounded at the printed output that I can produce on my Atari.

TG> I will also need some info about fonts and printers which are
TG> compatible with the ST. I currently use a dot matrix printer
TG> but I need to upgrade to at least an ink jet so I can print
TG> documents with decent quality.

I use a HP DJ500C every day, and it is very close to a plug and play
solution.

TG> I currently use Marcel WP which is decent but doesn't really
TG> compare to MS Word.

You are comparing freeware to a program that costs $400, last I
heard.

TG> If I do decide to keep the machine, I will also probably want
TG> to upgrade the monitor. My SM 124 just won't cut it anymore.
TG> Especially when everyone else gets to use these big beautiful
TG> color monitors to do their work. I think I already have some
TG> info in this but additional info is welcomed. I guess the
TG> bottom line of this post is to find out if it is still worth
TG> keeping my Atari or jumping ship and getting a PC. Money is a
TG> big factor, so I will be comparing the cost of keeping my
TG> Atari vs. selling it and buying a PC.

There are several options:
0) Buy a SM147. Bigger screen than the 124.

1) Graphics card for your ST.
1a) Hardware accelerator for your ST. I think some of them come with graphics card built in.
2) Buy a TT. Lots cheaper than you might think, very fast compared to an ST, runs a VGA monitor at 640x480x16 colors out of the box.
3) Buy a Falcon. More and better graphics than the TT, although it is a little slower for routine computer work.

I would recommend against selling your ST. It won't bring much, for one thing. Also, I know a musician who has a DX4-100 who still uses his Mega STe for MIDI.

Buying a pc might be a reasonable choice, but the musicians in this group have mentioned that getting the same capabilities out of a pc that the Falcon has out of the box is an *expensive* proposition. I do not do MIDI, but I do almost anything else than you can think of, and the TT (or even an ST) serves my needs and interests very well. Atarians do not have the luxury (or curse?) of having large corporations trying to cater to their every whim (or trying to increase their bottom line at the expense of the masses). But, as the current CAB/STik work demonstrates, the ST is *still* a useful machine - with useful software *still* being written.

:
: NVDI v3 is crap.

No - 3.02 is fantastic, I think. Not a word to complain. V4 should be
even better (it's available now).

: The CPX modules that come with it refues to load with memory protection
: turned on and take the entire XControl accessory out.

Don't know about that... They work perfectly in my accelerated Falcon
with FastRAM.

:
: Papyrus is crap.

No... 3.64 version is great, I think - and v 4.0x (available now, too)
will be fantastic, I believe. Papyrus feels to me like an old friend
after using Word or WP on Mac or PC ;-)...

: MultiTOS is crap.
: It is unstable and slooooo (where can I get a replacement AES?).

No objections here...
Why not use Geneva or MagiC 4 instead? They're _a lot_ better...

:
: Outside is crap.
: Yet again, unstable.
:
Yes, unstable. A bit buggy, but better than nothing in some situations.
Still, real Fast-RAM is The Solution.

: and I do not want all this grief. I mean no offence to anyone but all this has
: made me contemplate moving platform (surely not) and I do not want to.

Well, moving platform would result in..... crap =) !

That's what I know after using PCs, Macs and Ataris. Computing creates
crap; some systems just less than the others. I think, Atari isn't a
bad choice seeing things this way ;-)...

Greetings,
Crap... er... Tommi =)

You're alpha-testing the latest versions? Great! Please, oh please beg
them to add PPP support!! My local service provider only does PPP (NO
SLIP) and so I "cruise" the InterNet with Oasis...which is a fine program
but I don't get to WWW browse at all....I get unlimited hours for $29.95
which is great if I can just get an Atari Web browser that supports PPP!
Thanks in advance for any help/info! :)

I used an Amstrad video tuner to do this with my SC1435. The turner was
naff - but the monitor was well up to the job.

I haven't seen any updates around so chances are the author moved on. Is there any particluar reason that you want a GEM based .mod editor. There really are some excellnet non-gem based, including: Pro-tracker, Octalyser (8chans, STE/Falcon only), Audio-Scultor, and those are just for ST/STE... The falcon has some excellent (upto 32 track) mod editors. For some reason most .mod editors aren't GEM based, and because of this are usually quite fast...

>Hi Andrew,
>Any bit map file is going to be big, bit 3Mb is _really_ big!

It's massive isn't it.

I use Papyrus to output some of the fancy stuff - big text, tables etc as a
300 DPI IMG, there's a nice suitable driver included. Each page (A4) comes
out at well over 1Mb, even if there is a lot of white space. But this
Pagestream thing is double, at least, the average size!

I have never really used my copy of S/H copy ofPagestream, so can't comment
on it really, but I think the file size is a bit huge, unless there are
some monster graphics in it to start with!

IMGs have a reputation for being quite compact, so I don't think Andrew
would gain much by using another file format. Get the offender zipped down
and out of the way quick would be my only solution!

2460. XaAES Beta 1 released

Newsgroup: comp.sys.atari.st
Date: 1996-02-06 00:00:00 UTC
From: "Craig. Graham" <Craig.Graham@ncl.ac.uk>
Message-ID: <4f8ga9$bav@whitbeck.ncl.ac.uk>
Source record: 151225

I mailled out the first beta of XaAES tonite to all the people who contacted me about it. This is only a work-in-progress & techie beta, and isn't intended for general use (and indeed is sod all use in day to day work). If one in 10 of the folks who said they would help actually produce something to go in there, the system should progress much faster from this point onwards.

If any of our MiNT & GEM coding guru's wanted to help but haven't contacted me yet, now is the time to do it.

Please DO NOT mail me if you aren't able to help, as I'll just end up with a mailbox full of 'my favourite word processor won't run under XaAES' type messages - I know that already, I don't need telling.

Craig.

Are you running Hsmodem ? if not give that a go I find it works a
treat with this sort of problem Im sure there is something in the docs
about this. As for logging in via a comms package its possible but I
have never tried it you should be able to login as normal with say
connect exit enable stik then goto the other stuff option then ip
address then enter your ip address there manually. Bit of a pain but
it should work.

>Why is that ???? You only have to consequently apply the definition of
>client/server systems, and it's not the "other way round from normal
>networking terminology" !

I'm not sure what you are getting worked up about.

In normal networking technology - the workstation on the user's desk is the client. It is serviced by the server - which is normally some form of central machine.

With X, the workstation is the server as it is servicing X requests from the client applications - which often are running on a seperate box. Many workstations (servers) might share the same central box (client engine for lack of a better term).

Often the workstation is both the X client and server - and at the same time is a client for a central file server.

This might be all obvious to you - but many people consider the terms client/server to be reversed around under X.

>(what about games?). What are the minimal system requirements? In
>other words: Is it worth it?

Its a bit risky, but depends a little on what sort of things you are
planning on running. Anything badly written, or which contacts the
hardware directly, is likely to run into problems. Also most games
are unlikely to run, or at least run properly. Also you are unlikely
to be able to complain to people when the program doesn't run
properly, as they will just tell you that the program wasn't written
to run on anything but a mac or PC..

Get a Falcon instead, they are far better !

From: tderrick@acpu.com
Message-ID: <9602090401342686 4@acpu.com>
Source record: 151236

hbact182@csun.edu (tejinder gill) spake thusly:
TG> Subject: Hard Drive
TG> for my 1040 I would like to get a hard drive for my Old Atari
TG> 1040 ST. I would like to know if I could get a generic hard
TG> drive (for a PC or something) and modify it to work with the
TG> 1040. If anyone knows info on this topic, I would appreciate
TG> if you could get back to me.

You cannot use an IDE drive with your ST, but any SCSI drive should work. You will need a 'host adaptor', such as The Link II, to connect from your ST's DMA port to the hard drive.

What are you going to store in this drive? Do you need a *lot* of room, for picture or sound files, or will it mostly be programs and data files? There are almost always a few 30M - 100M hard drives with host adaptor and box with power supply available for sale in this newsgroup for quite reasonable prices (~$100US). The Link II is selling at retail for ~$90US, so buying a complete used hard drive sub-system might be an attractive option for you.

Source record: 151237

hbact182@csun.edu (tejinder gill) spake thusly:

TG> I have been deciding whether or not I will continue using my
TG> 1040ST as my main computer. I have been primarily been using
TG> it for music sequencing but now I would like to see if I can
TG> get more out of it. I often read this group and so I know
TG> what the machine is capable of to some degree. I already have
TG> a pretty good Database app for it and it serves my purpose
TG> well. What are some of the good word processors that are
TG> still available. Do they compare to Microsoft Word for the PC?

I am told that Papyrus does. Personally, for any *serious*
presentations, I will probably stay with PageSTream; it is pretty
useless for text entry, but that is what text editors are for. The
general trend (for several years now) is to blur the distinctions
between DTP and Word Processing; that is what MS Word, WordPerfect,
and their competitors do. And for many people, that is the best way
to go. But a text editor/DTP combo, well learned, provides more
flexibility. The WordPerfect types that my wife works with are
astounded at the printed output that I can produce on my Atari.

TG> I will also need some info about fonts and printers which are
TG> compatible with the ST. I currently use a dot matrix printer
TG> but I need to upgrade to at least an ink jet so I can print
TG> documents with decent quality.

I use a HP DJ500C every day, and it is very close to a plug and play
solution.

TG> I currently use Marcel WP which is decent but doesn't really
TG> compare to MS Word.

You are comparing freeware to a program that costs $400, last I
heard.

TG> If I do decide to keep the machine, I will also probably want
TG> to upgrade the monitor. My SM 124 just won't cut it anymore.
TG> Especially when everyone else gets to use these big beautiful
TG> color monitors to do their work. I think I already have some
TG> info in this but additional info is welcomed. I guess the
TG> bottom line of this post is to find out if it is still worth
TG> keeping my Atari or jumping ship and getting a PC. Money is a
TG> big factor, so I will be comparing the cost of keeping my
TG> Atari vs. selling it and buying a PC.

There are several options:
0) Buy a SM147. Bigger screen than the 124.

1) Graphics card for your ST.
1a) Hardware accelerator for your ST. I think some of them come with graphics card built in.
2) Buy a TT. Lots cheaper than you might think, very fast compared to an ST, runs a VGA monitor at 640x480x16 colors out of the box.
3) Buy a Falcon. More and better graphics than the TT, although it is a little slower for routine computer work.

I would recommend against selling your ST. It won't bring much, for one thing. Also, I know a musician who has a DX4-100 who still uses his Mega STe for MIDI.

Buying a pc might be a reasonable choice, but the musicians in this group have mentioned that getting the same capabilities out of a pc that the Falcon has out of the box is an *expensive* proposition. I do not do MIDI, but I do almost anything else than you can think of, and the TT (or even an ST) serves my needs and interests very well. Atarians do not have the luxury (or curse?) of having large corporations trying to cater to their every whim (or trying to increase their bottom line at the expense of the masses). But, as the current CAB/STik work demonstrates, the ST is *still* a useful machine - with useful software *still* being written.

First of all although WWW has been released, its very much still in development, and bugs are being (created?) and fixed all the time. It would be a good idea to try and get a later version (latest is V1.16) from Hensa. The latest version has number of example scripts for popular ISP, which you can look at. If you still have a problem with V1.16 then mail me and I'll see if I can help.

2475. STiK&CAB (WWW) FAQ ???

Newsgroup: comp.sys.atari.st
Date: 1996-02-06 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <823712190_OASIS_@phil4.demon.co.uk>
Source record: 151240

Week in week out I see articles on this group asking for help with
STiK and CAB.... Would it be possible for someone to try and write a
sort of FAQ listing the common problems, and some of the methods
suggested for fixing them ???

Other suggested topics for inclusion:

the 00000000.HTM problem
wher to get the latest version
known bugs
where progs for STiK (eg. FTP) can be found
whats next in development
what bugs/enhancements are included in the latest versions.

If anyone who uses STiK and CAB regularly would like to take this up,
it shouldn't be to hard. Any questions could be refered to this FAQ,
and then any problems not answered in it could be put to the group and
the replys placed in the FAQ...

What do you think ???

AFAIK almost all floppy disks will corrupt themselves VERY VERY soon
if you start to format over the standard (eg. 10 sectors 79 tracks for
DD), its a risk that you may like to take, but best used ONLY on disks
which you use very rarely (and not for important data like backups).

>
>In any case, it's pushing the envelope. I myself couldn't live with a

Personally the only reason I'd want my HDD messing up is when I make a
mess recovering a file.... not becuase of bad sectors ! (I've had my
48Meg HDD in my MegaSTE for ~5 years now and use it very often, but
have had no bad sectors so far !)

You seem to be having a LOT more problems than I have have with these softs ..

But can I suggest the evironment you really want to get to run above is Linux/68k which really is the best os to run GCC on an atari. You'll need 16meg though to make most of this however ...but then this will be cheaper than getting a PC and sticking the required 16 meg in that <G> ... I can have my Falcon compiling half a dozen tings at the same time on my linux system should I require and it runs a lot better than it did from mint ... as you know mint and outside do not work well together but linux has nice working swap support .... well lets see I rephrase that it does not crash for ME :-))

>lose with the lower price. But, even semi successful Shareware authors may
>only get a few registrations a month. Even at the current pricing levels,
>most can't survive on that kind of income, and it certainly doesn't pay back
>the development time they've invested.

This is where I really think that Shareware is no longer shareware..
where a company is set up and develops 'shareware' procducts,
releasing the crippleware into the FTP libs etc. and then charge cash
for the registration. IMHO this is the same as releasing demo of the
prog (on mag coverdisks etc.) and then just selling the final product,
The only real difference I can see is that the opperation is much
smaller, and the products are usually a tad cheaper, and the label on
the software says shareware rather than commercial. Personally I'd
like to get back to the days when shareare was cheap (5quid) and
commercialware wasn't.... where the distinction is easy to see.
nowadays its not so easy. as one reply said it is more risky buying
shareware.

>
>P >i)Can the person selling, sell the registered version of the software
>
>I can only speak for myself (Mountain Software), but I have no problem with
>users selling my products to other users as long as they notify me of the
>sale (so that I know who to send update notices and new product
>announcements).
Is this purely for a profit point of view (ie. sell people more
software) or so that bugs can be fixed etc ??

>
>P >ii)Does the person buying have to re-register the software
>P >iii)What about the persons name address etc. that are entered at

>
>I'm running Freemint-1.12.4 and Minix 0.610b, and ls of a directory with,
>for example, 20 files in, takes a few seconds.

Hmm.. well:-

(a) ls has to be found in the filesystem
then (b) ls has to be loaded into memory
then (c) ls has to read the directory using loads of system calls.
then (d) ls has to sort the files
only then (e) ls prints them out.

>An ls should be instantaneous, no matter how many files reside in the
>directory.

Not correct, the sorting process is dependent upon the number of files, and
on a TOS directory directory size makes a HUGE difference to directory
reading speed.

>The above speed doesn't occur only when I'm running lots of processes. If I
>only have Mint and Tcsh running, the ls still takes this long. I have only
>2MB of memory, but this shouldn't affect the time either.

Which is why I suggest it's not a "MiNT" problem, more a generic problem.
Unlike UNIX, MiNT does not cache the disk accesses in unused memory, which
slows MiNT down a GREAT DEAL when doing disk work.

>Now don't get me wrong, Mint on a 8mhz STE is fun, but not particularly
>useable.

Oh.. how people today are spoilt, I remember when..... :-)

>I just finally got Init working, albeit with a few errors, like a weird one
>which happens every so often when it doesn't find /pipe/log; why it would
>want a log in the pipe directory puzzles me.

It's not a log in /pipe, it's a fifo in /pipe created when syslogd starts.

Falcon can't really be compared to a 486 dx2/66. It's for sure slower if you speak of the 68030. But if you want:
-Dma sound with professionnal quality
-Good graphics
-Network port
-scsi port
dsp and dsp port
and so one...
You will pay a LOT with your PC, and maybe it won't work at all, because of interruptions conflicts.
If you want a better evaluation, take a Falcon with a 68040/66 mhz board. About 10000 french francs. It will be far better than a 90 mhz pentium for the same price.
For C coding Pc's are as good as an Atari. But for assembly coding Atari's (and Amiga's) are just the best.
Well, that's my opinion...
For ST's it's a different problem.It can still be used for several things, but for modern usage (the so called "multimedia") it's too slow. Except if you pump it with an accelerator board...

nonsense. A complete 486dx2/66 (gus or wavetable soundcard, networkcard,
2MB svga video card, 8Mb, 540Mb hard, 15" svga monitor) you can buy for
about NLG2000 (=US$1300). No hassle for installation, it comes as a
complete setup.

In fact, you want a Falcon with a faster cpu and a better graphic card :-)
The Falcon is a great mahine (I use one). There would be very little change to do to transform it on a very powerfull machine, according to today's standard.
The biggest point is a 32 or 64 bit bus, running at the less at 32 mhz.
A ppc is maybe not the best solution, because it will just emulate the 680x0 range. It will be slower, and don't forget there are no compiler's for ppc on atari yet!
Does anybody have the internet adress of Atari itself? We could send mail to say what we want, who knows?

2486. Re: MagiC

MagiC is a multitasking system that replaces the standard TOS. It's much faster, cooler, it implements all MiNT fonctions. It can even be put in eprom's if you don't want to spend too much memory! It's a little bit expensive :-(and still in german language only.

2488. MiNT Console Size

Newsgroup: comp.sys.atari.st
Date: 1996-02-06 00:00:00 UTC
From: nickf@zebedee.cadence.com
Message-ID: <NICKF.96Feb6103410@zebedee.cadence.com>
Source record: 151262

Does anyone know how to switch the console of an ST running MiNT from
25 rows to 50 rows? i.e. so that the text font size decreases. I used
to do this with Gulam and found the increased resolution a great
help. As I'm running MiNT, Gulam is no longer an option.

Thanks in advance,

Nick.

From: avg@cwi.nl
Message-ID: <avg.823610332@news.cwi.nl>
Source record: 151263

Hello.

I just bought a copy of Cubase 3.0, and I am experiencing problems converting old Cubase 2.0 songs, due to lack of memory.

It seems that Cubase insists on running in ST Ram (I get something like 10 bombs otherwise). Too bad, because I've got 2mb of ST-Ram and 4mb of TT-Ram. Is there any way of getting Cubase to work in TT-Ram?

Any hints would be greatly appreciated...

I've heard different advice from different people. I thought that I could buy any SCSI drive and plug it into the back of my 1040STFM via a suitable adapter (mine's a GE-SOFT). I seem to remember this being the advice in Atari World. Having purchased a 340MB drive via a PC mag, I was informed that ones sold for PC's do not work with Atari :-((Something to do with termination or parity. Lucky for me, the supplier Gasteiner Technologies have agreed to replace it with one that does work.

Just be careful

Andy

Not being a techie, I'm not sure that a Power PC would be the god send people believe. Unless
the software is compiled for the PPC, it only emulates a 68000 but much faster. Look at the Apple and PC markets, particularly the Pentium which was introduced as having some parallel processing. The software just didnï¿½t take advantage of it and now their're back to 8086 code
on the pentium pro. This takes CISC instructions and converts them to RISC.

Anyone know how the 68030 specific software for the Falcon or TT would run on a PPC?

Andy

On of the problems with selling the Falcon in the UK was that in the stores it was positioned next to PC with Windows doing thing. The Falcon sat there just displaying the ï¿½good
oli¿½ GEM desktop, which I think youï¿½ll agree in not the most inspiring piece of software. If
only Atari has given the stores some demoï¿½s of software. Iï¿½ve been in these store when people
are being sold 486DX25 4MB and being told it will run Win95 because ï¿½look the logo is on the
Screenï¿½. How can we combat such ignorance?

>The only good solution is to build a computer which is able to run

Oh! You mean put TWO processors in the machine, a RISC and Pentium. This would just price it out of the market. It cheaper to build a PC. In the UK and company called Acorn tried that
with their ARM machines. Great success ... I think not!

Though for demo purposes, there could be a machine with an optional PC emulator in just to show
people its possible. However there that bug work again ... cost.

Recently there was a thread ï¿½You ideal machineï¿½ (or something). Most people who replied seemed to agree with you. Basically a 68040/060 Falcon with SIMMS, EIDE SCSI and PCI interfaces running something like Linux or Ease/MagiC. In the Feb issue of ST Format, there was an article from the ProTOS show in Germany detailing the ï¿½Hadesï¿½ computer which was very
close to the above system. Any details anyone?

Andy.

>What is MagiC that everyone is talking about. It sounds cool.
>will it work on a 2.5 meg st?

Yep.

MagiC 2.0 ...

Much more stable, faster than TOS and it multitasks pre-emptively unlike some Micro$loth GUI we won't mention. TOS programs run in a window alongside the Gem ones and you don't need to upgrade to TOS 2.06 either because it can do the same things and more. It can also be persuaded to run most 'orribly programmed software in singletasking mode. A lot of accessories can be run like normal programs. There's a program manager which you can use to kill off things which have hung or just suspend programs and I'm still amazed at how well it detects memory corruption and manages to recover, as the 68000 has no hardware to do this. The enviroment can be set up as well so even my ten year old MWC compiler trundles along in parallel with everything else (but the command shell pipes and filters have bust - why?). Programs which insist on grabbing all the memory can be made to behave as well. There is an equivilent to the auto folder - anything in there gets started in parallel on booting by MagiC.

The downside, is that accessories are disabled in singletasking mode but after a short while I chucked most things that were troublesome. The display can get a bit jumpy when lots of processes are doing a lot of disk access because this happens in supervisor mode which suspends multitasking but multitask it continues to do. Unless radical changes have happened to the MagiC desktop program then don't bother with it - I use Ease but there are plenty of other replacement desktops. You can tell MagiC what desktop to load, it only loads its own if it can't find another. When MagiC detects memory corruption its kills the program, the others continue which means it won't run buggy stuff that you have been happily using for years - but then you can run it under plain TOS anyway.

If you get it, spend a couple of days reorganising your hard disk and setting it up. I had it running in about half an hour (with Ease and Kolbold) and wasn't impressed. I then read all the manuals a couple of times (about the only time I ever have!) and set it up properly and was very impressed. I haven't had to mess with it since (months ago).

I think the higher versions are still not in English atm.

One other thing, I've not had any hard disk corruption either - I used to gets lots of trashed FATs and directories under TOS.

I'd best shut up, it's becoming an essay :-)

In a message of <03.02.96>, TOMMY K. HWANG (2:200/427.1) writes:
TKH> 68060 has been released for ages. I can get them
TKH> 'fairly' easily for my Amiga 4000.

The only thing that makes it less attractive for the moment is that the 060
accellerator boards available for the Amiga are equipped with a pre-production
series of the CPU (according to the markings on it, taken from a list of CPU
types from Motorola), which means that they're not in serial production yet...
I'm afraid they can contain some bugs since it still is a pre-production series
(but Amiga users are used to bugs, so why bother?).
Since Power PC accellerators will appear very soon, perhaps they're more fun...

TKH> Don't what to as I
TKH> don't need it (think my next processor upgrade for that
TKH> monster is the PPC CPU). The avarage price for 68060 CPU for
TKH> the Amiga2000 (there is only 1) is $1495.00 (US), Amiga1200
TKH> (about $1000.00), Amiga 4000 (about $1400.00).

I can't see of what interest Amiga accellerators could be to Atari users, but
it would be nice to have these boards available for the Falcon as well,
wouldn't it?

Me too, however after using a PC at work I've decided to stay with the ST. I can do everything I need. Some would say slower, but after you take into account the 'idle' time spent re-boot after a crash or lockup, maybe not that different.

>well. What are some of the good word processors that are still available.
>Do they compare to Microsoft Word for the PC?

Yes, Thats Write, Papyrus 4, both are still being developed.

> I will also need some info about fonts and printers which are compatible

Get NVDI 3 or 4, it not only increases the speed of the system, but also allows the use of Bitstream Speedo, Postscript and Truetype (Windows 3.1) fonts.

>Thanks for any help
>
As I work in the computer industry, I'm asked what the best system to buy is. My advice is 'think what you want to do, think of a budget then buy the best system which fits the criteria'. Most people seem to just ship because that see the PC a something better, but you
can only type so fast, or play music so much at one time.

From what I've seen, if you move to a PC be prepared to spend money and continue spending money. I use a 486DX2 50Mhz 16MB ram at work and our supplier has stated that the new version

of software will only be available on Win95 / WinNT, which requires faster/bigger PC for the
same performance as I get now, and my PC is only 2 yrs old !!!

Whatever you choose, please, please, please don't be one of those SAD people which come back to
this newgroup and start a STUPID 'my computer's better that yours' arguments. Otherwise you'll
be welcome.

'live life and be happy' :-))

It's true that parity must be disabled on the HD you want to use with your ST.

I've heard that the new ICD host adapter "The Link 2" fixes this problem.

Since I only have "The Link", I've made a parity generator myself and it works fine. It's very simple, only two TTL IC: a 74LS181 (8 bits parity generator) and a 74LS06 (open collector output inverter).

>eight notes per channel?

I have Omega. There is no function to do this. But, on the Tiger editing screen (a module in Omega to display notes in piano-roll style), you can see at a glance how many notes are sounding simultaneously (although sustain pedal information can cloud things up).

You may find you have to run 'sleep' after syslogd to give it a chance
to kick in before running the rest of your rc script(s).

: >whopping 3.3 MB. What on earth can I do with this, even on a 4MB STe? I'd
: >like to convert the IMG to a more compact filesize, ideally a TIF or GIF
: >file.

Doesn't PageStream save PS?

: IMGs are fairly good compression. Switching to tiff or GIF wouldn't save more
: than 10% or so. (assuming Pagestream saves properly compressed files that is)

Saving as GIF gives 1/4 - 1/2 better compression depending on amount
of colors. IMG uses a simple run lenght encoding while gif uses LZW.

Tiff has different compression methods.

: I can't think of any way for you to convert it though when it's too large to fit
: in memory (you might just get one to work if you removed all accs and auto
: programs?)

I doubt it would work. Converters will probably want to load the image
wholly into memory and if the file is 3.3 MB _compressed_ (as IMG) it
won't fit into 4MB.

> directory.
>

On my setup - an 8MHz ST (TOS 1.02 !) - ls is pretty instantaneous
(with MiNT 1.12 and Minix 0.610). Are you using the V2 filesystem?
This may make things a little quicker for you (as may an upgrade on
your hd driver).

> The above speed doesn't occur only when I'm running lots of processes. If I
> only have Mint and Tcsh running, the ls still takes this long. I have only
> 2MB of memory, but this shouldn't affect the time either.
>

Although I find it extremely frustrating (i.e. almost impossible) to
develop any real code on my ST, I do find it quick enough to run
general system administration tasks. This is particularly true when
running a few virtual consoles at once.

> Now don't get me wrong, Mint on a 8mhz STE is fun, but not particularly
> useable.
>

Although I feel my 8MHz ST is _very_ limited I have been using it for
some time for archiving and back up of my Linux box. It does this
across a SLIP connection with MiNT NET withought any real problems.

#>MagiC is a multitasking system that replaces the standard TOS. It's much
#>faster, cooler, it implements all MiNT fonctions.
^^^
No, it doesn't. MagiC lacks many things, for example threads, signals, multi-
user support. Even worse: MagiC supports extended filesystems and loadable
device drivers, but in a totally different way. So you can't use all that
nice stuff like MinixFS, MiNTNet, etc. without re-coding or "wrapping" them.

Ciao

Thomas

P.S.: Don't get me wrong: I use MagiC 4 quite often (I'm currently writing
a ramdisk-XFS for it), and it has a lot of advantages over MiNT. But,
OTOH, it also lacks important (IMO) things which only MiNT offers.

Yep, us poor gits on Demon are being excluded. :o(

I don't think it is Demon's fault though. I get a fair bit of e-mail every day, & it all seems to arrive timeously. some of it is from a listserver somewhere in USA. So if Demon's machine is so damn busy, why is it picking on the CAB mailing list? I got the message from Dancer about how it couldn't post to us, & I saw my own name on that list about 10 times, but I find it hard to believe that the post machine is too busy.

As far as I could see, there was no great loss. I was receiving maybe 10 messages a day, most of which had become a conversation between 2 guys that held absolutely no interest for me. If the traffic is high enough, what about a newsgroup?

Also, if anyone is still getting the news from the listserver, could they post the distilled knowledge & wisdom here once a week? Cut out all the conversational crap & we'll be eternally grateful!

One last thing. From what I could make out, all the development work being done on CAB & CAB overlay at the moment is aimed at MiNTnet. Tell me it is not true. Please. And if it is, how about some bugger rectifying this?

Source record: 151286

I agree that a new system must be able to emulate all the currently popular systems. In fact, I think that if there is to be any significant advance in home- and business-based computing, this is a necessity rather than a luxury. Surely most people are beginning to wake up to the fact that PCs are hellish, archaic lumps of money-eating shite - even though they are colourful & fast (?) & powerful (?). Personally, I feel that a system that could run WINDOWS 95 at a reasonable speed, the latest Mac OS (are they still on system 7?), TOS 2.06 (at least), and at least have a stab at the Archimedes operating system should be possible. But what do I know, right? Well, with the current mimiaturisation technology allowing entire PC motherboards to exist on a single chip, surely multiple OS could live on just a couple? If a separate chip was used to map hardware calls to the actual hardware devices & to do some hardware emulation as a parallel process, then the hardware should be OS independent.

Such a beast might be expensive to start with, but it would drop in price as technology advanced & as people invested. And I'd be pretty sure that the first OS that could be dropped due to lack of use would be that ancient & slow piece of shite designed by Gates.

All of this is straight off the cuff with no sort of research, so it may be a load of bunkum. While I'm at the bunkum, surely the actual OS could be hidden from Joe Public? Float a desktop above all the OS crap (Ease would be a good starting point), and when a program is clicked on, then the OS is loaded, the program is loaded, and the data file is loaded.

Hell, I've convinced myself that it is possible. Any ideas? Any developers want to give me some money for mine? :o]

2514. FS: TT and ST's

Newsgroup: comp.sys.atari.st
Date: 1996-02-06 00:00:00 UTC
From: smiller@farad.elee.calpoly.edu
Message-ID: <4f72mu$k81@isnews.csc.calpoly.edu>
Source record: 151288

I have -

(1) Atari TT 2mb ST ram, no harddrive in perfect working condition
(1) PTC 1426 Color Monitor
(1) SLM 605 laser printer in very good condition

I am looking for around $600 dollars for the whole lot. I will throw in some random software too, for the interested party. The TT has no harddrive because it is in my new one, along with my new 16 meg TT ram board and Nova graphics card (very nice by the way)

I also have -

(2) 520 ST's (the ones with no internal drives)
(1) monochrome monitor
(1) color monitor
(2) ATARI SF354 disk drives
(1) ATARI SF314 disk drive
(1) custom drive enclosure with two drives mounted on top of each other
(1) trackball
(3) joysticks
(?) 50 + games with the original disks, most with documentation

I am asking for $200 for the whole lot or best offer

I would prefer not to break up the TT system, but I will if necessary. I will take best offer on the TT system also, but I don't think $600 is too much considering you are getting a very good color monitor, a very fast and nice laser printer, and a fast 68030 based machine.
Shipping is not included on anything.
I do not rip people off and I have sold some items to another through the net and everything worked out just fine.

Let me know if you are interested in any of the above items.

Thanks!

*steve

You forgot to mention an OS ?
To install any decent OS for the PC you need a CD-ROM and the Linux CD.
Then you need a bit more RAM and hard disk space.

The same goes for Windoze '95 (- see its already out of date !)

You are right, this configuratin is cheap. But, it is now outdated. A recent article just looking at the Denver market, notes that manufacturers misread consumers. They thought that these cheaper configurations would sell. They didn't. There is now a glut (at least in this market).

I have four brother-in-laws with PC's (one with this setup - but with 16mb mem and 28.8 modem). I (the "Atari guy") find, unzip, install and show them how to use their programs. I still get frustrated with their systems. PC's become senile very quickly. If you don't have the CD rom player, you really don't have anything. Better to talk about that then the PC's architecture and opsys as they are biggie!

2519. IOMEGA's ZIP drive on a Falcon.

Hi there,
As I plan to buy a ZIP drive for my Falcon, I'd like to be sure that
it works on a Falcon. Does anyone here use one, and does it work
correctly with the Atari driver (AHDI 6.06) ?
Thanks, Eddy.

You can use AHDI to reformat the drive.

You don't say which version of TOS you have, but AHDI 5.04 should let you have
a partition size of at least 128 Mbyte.

Supra have a BBS (don't have the number - sorry) & the utilities were there.

You won't find them on the net because they are commercial.

I have been ordered to make some digrams and stuff in school, so I need some numbers. Can everyone reading this *PLEASE* answer in a netmail to: lavin@canit.se OR lavin@karkis.canit.se! I really need your help to get approved.

Questions:

1. What computer is your main one? (i.e. the one you use most)
(e.g. Amiga, PC, Mac, Atari...)

2. When did you get this computer?

3. When did you get your FIRST computer ever?

4. What computer do you like most? (Maybe you have an Mac, but you would prefer having an Atari.)

So PLEASE answer in a NETMAIL.

Thanks!

Hi- this has the ICD host adapter and AT style case with room and cables for 2 hard drives (thus, you can add another hard disk with no fuss).

Comes with one formatted cartridge with some software, and DMA cable for 'plug and play' connectivity to your ST/e.

$140 shipped.

>
>

It currently would be difficult to have TOS, Win95 and Archimedies running on the same hardware. However it is easiler to make the OS independent of the hardware, ie WindowNT (sorry but it was the only example I could think of). What we need is a defined set of Reference Hardware, OS and Software API's.

PIG's would fly before this happens, look at what a cockup UNIX was before WinNT came along. It is however possible, look at the Atari market. There are three hardware platforms (Medussa, Eagle, C-lab Falcon), three/four OS's (Ease-MagiC, Neodesk-Geneva, Mint, (Multi)TOS) and software for one generally runs on another. Each has its strengths/weeknesses.

It could be just me dreaming again but could the Atari market be setting an example to others .... oh! look "PIGs in space".

Andy.

OK, first things first. What do you intend using your setup for? If you only want to word process, then why even look at a PC? Believe me, Word is a massively overrated program. It is a huge, sprawling, flabby monstrosity. It is slow, and it is difficult to find a particular function even with the aid of the help function. It has a superior on the Atari platform if you only want to word process. It is called Papyrus. The new version is either ready or almost ready, and it will do everything you need.

If your tastes run to DTP, then Word for Windows comes in a poor second place to Calamus. If black n' white will do you, you can pick this up for 59 UK punds. This program may well have been written 9 years ago, but it will still do almost everything you are likely to want to do.

For databases, there are several choices. TWIST 2 seems to be unbeatable, although I haven't used it myself. AtariWorks is a fine program as well, and also offers you the ability to exchange data freely between the WP, DB & spreadsheet. This is the program I use for all my DB/SS needs.

For font handlers, use NVDI 3. This gives your atari vector font capabilities, and allows you to use TrueType fonts. Yep, exactly the same fonts you'd be using on a PC. This font handling is a 'side issue' by the way. NVDI's main job is to accelerate graphics output on your ST. You will never use your computer without it again.

As for printers, most are compatible. I use the Canon BJ-10sx, and it gives a beautiful output using either Calamus or any of the other programs mentioned (via NVDI). Of course, monochrome is all I need. According to things on this group, watch out for HP printers as they don't have hardware controls. Software controls are only available for PCs at the moment. However, if you are using TrueType fonts via NVDI, you shouldn't really need to access the printer's internal fonts.

Finally, you mentioned monitors. You won't be able to use a high resolution colour monitor without spending big bucks on a graphics card. Don't get rid of your monochrome monitor. It is the dog's whatsits for any serious work. Colour is overrated anyway.
<FX: mono monitor owner grumbles incoherently to himself>
Seriously, though, what do you need a colour screen for? You can still output in colour if you need to. Black and white leads to less eye strain.

You will need to buy more memory. Go for 4 Mb. This should be enough. It needs to be, as it is the maximum you can manage on an ST! <GRIN> I rarely run out. I only do if I'm doing stupid things. PC owners can't even run some games in 8 Mb.

A point to make a note of here is how technically gifted you are. If you aren't gifted, _DON'T_ go near a PC. They will give you headaches. In fact, Do go near one! Go and play with one for a while. Don't let a smarmy salesman show it off; actually use it for a period of an hour or two. A local college might be able to help out here. If you aren't desperate to get back to your ST by that time, then you probably need to make a very expensive mistake :o)))))))).

Hope this helps. If any of it seems garbled, feel free to e-mail me.

Source record: 151300

The problem that I see with upgrading your current Atari is that if you want a nice color monitor you'll probably want a video card. Or would you be willing to work in the standard Atari color modes (low and medium)? You might want to hunt for either a used Falcon (probably cost around $600-700) or Mega STe with a video card. There are also cards available for the ST but I am not sure about the price. Someone want to help out?
-scott tirrell
Oh, I think you'll find that there are comparable WP programs to MS Word. AtariWorks, while not having as many features, does what I need and output to my Canon BJ-5 is nice via Speedo.

Hello Philips,
If you use AHDI you've got no choise, but with almost any other hard disk
driver you can set the boot order of the different drives.
I believe you should buy SCSI-tools, ICD Pro or HDDriver to get the function
you're after.

Best regards,

Claes

In short, my keyboard now works fine. Thanks to everyone who replied.

I replaced many things on the motherboard (it seemed the problem
wouldn't happen as soon after each replacement). It didn't go completely
away until I replaced two resistors (and a capaciter while I was at it).
These were on the underside near the keyboard jumper, labeled on mine as
R188, R194, and C207. Damn those are small, and easily lost BTW :).
Email me if you want more info.

Take care,

George

Source record: 151348

My DREAM Atari? Wellllllll, let's see...

-A PowerPC 604 CPU;
-Embedded FireWire support(that's the new SCSI-3 spec, better
known as P1394; 100Mb/sec data transfer rate, upgradeable to 400,
finds its OWN interrupt settings so I ain't gotta f*** about with
it, PLUS it allows hot swaps in case I decide to act crazy one
night)
-100+MHz PCI data bus;
-LocalTalk support(so I could buy more than one since I need
that LAN in my house so badly);
-LOTS of RAM space(in the multi-gigabyte range, yes);
-The usual MIDI ports and stereo outs;
-High-speed CD-ROM unit(natch);
-Either a ZIP Drive or an EZ135 in place of the usual floppy
(cause all my friends use Win95, so my computer doesn't talk to anyone but other Ataris);

And since I'm DREAMING here, the whole thing would still
cost less than a grand... :)

How's that?

The best you can do will be to set the program header flags to fastload.
Setfast.prg will do the job, also if you have Neodesk or Ease... If this
is what is wrong, then the speedup will be dramatic.

Hope this helps...

Hello,

Curently, you need a SCSI drive and a host adapter to plug on the
DMA port. For example, I use "The Link" from ICD. You can also
get an ATARI hard drive wich contain everything to work with a ST.

To my mind, they are small, old and expensive so the first solution
is better.

Hope this helps.

GS> within a few seconds. It has never come back a second time.

Hi George,
I would suspect a bad 6850 chip.
I've repaired a Falcon with an almost similar problem by exchanging the 6850 that's close to the keyboard connector on the PCB. It could also be a bad soldering on one of the pins of the chip.
A normal reaction however, is the key-click at reboot or cold-start. In this case it's a bug and you only have to press a key to stop it, but in your description it didn't sound like it's this well-known bug you've discovered...

Good luck!

2543. Memory Upgrade

Newsgroup: comp.sys.atari.st
Date: 1996-02-07 00:00:00 UTC
From: James Marson <ley5jm1@lzn1.nott.ac.uk>
Message-ID: <4fasn9$o9p@griffin.ccc.nottingham.ac.uk>
Source record: 151007

Last year I sent off to Go Direct (UK) via ST Review magazine for two memory upgrades for STFM's. We later realise they had to be soldered and so sent them to them for upgrading. A week after receiving them on of the ST's would only recognise the initial 512K. We sent it back and it has since been fine. Almost a year later the same problem has happened to the other ST. Unfortunately Go Direct has ceased trading leaving me with a 512K STFM and useless Warrantly (with 1 week left on it).

Has anyone experienced any similar problems. Would it be just a case of pushing the chip in more firmly or would soldering be required.

I hope someone will be able to help. Thanks

James

That GE-Soft TOPlink adaptor does support drives that want a parity bit. There
are only a few drives that actually don't work on current link-style adaptors.
These are Quantum Empire and Fireball drives, and some IBM drives.

It is unfortunate that it has come to this. After eight years of faithful use and fun I have had to succumb to Intel(itis) and settled on a Pentium 100 PCI based system. My trusty MegaST4 now sits in the corner of my study and is used only when I can't do certain items on my PC. The bulk of the pressure has come from work. I had found it increasingly difficult to bring projects home because of incompatabilities (can't run 80x86 code on a 68K). So over the next few months i'll be transfering the required files to the PC via Ghostlink and then selling my MegaST4. Have I done the right thing I ask myself, only time will tell.

Nino Benci.

>recommend Hsmodem over Fserial, but on some people Hsmodem doesn't work.

In my experience this is totally wrong. I have succesefully used
version of STiK and CAB from the first release, upto the present
V1.16, without either of the above programs. The only reason the
above programs would be needed are to speed up the serial port, if you
are considering using anything over 19200bps (or 14400 with
compression), or to sort a flow control bug, which to be honest is
only likely to manifest itself when sending out data, in large
quantities (say 20K on a 14400bps modem, and thats at a solid 1800cps,
not often found on the internet, and definately not with WWW !).

>

I'm daft enough to have the keyboard shortcuts in TOS, as S for show
info and D for delete, and as the two get used often, and I sometimes
hit the wrong key ! I always keep confirm deletes ON.

Yes there is a way to do this.
1) make sure STiK is disabled
2) use a term program to login and get your IP address
3) leave your term program but do noy hang up FZD will do this and I use a
simple terminal program accessory (miniterm)
4) enable STiK and then go into other stuff. In there you will see you can set
your IP address.

That should be it!

Hope this helps,
Bob

You didn't get my point, _either_ RGB or composite should work fine, as
opposed to an HF antenna-signal. _How_ to do it, ie. what wires to connect
I don't know. I don't have schematics or manuals for the SC1224.

g > I can't believe people still own Atari machines. I got rid of
g > mine years

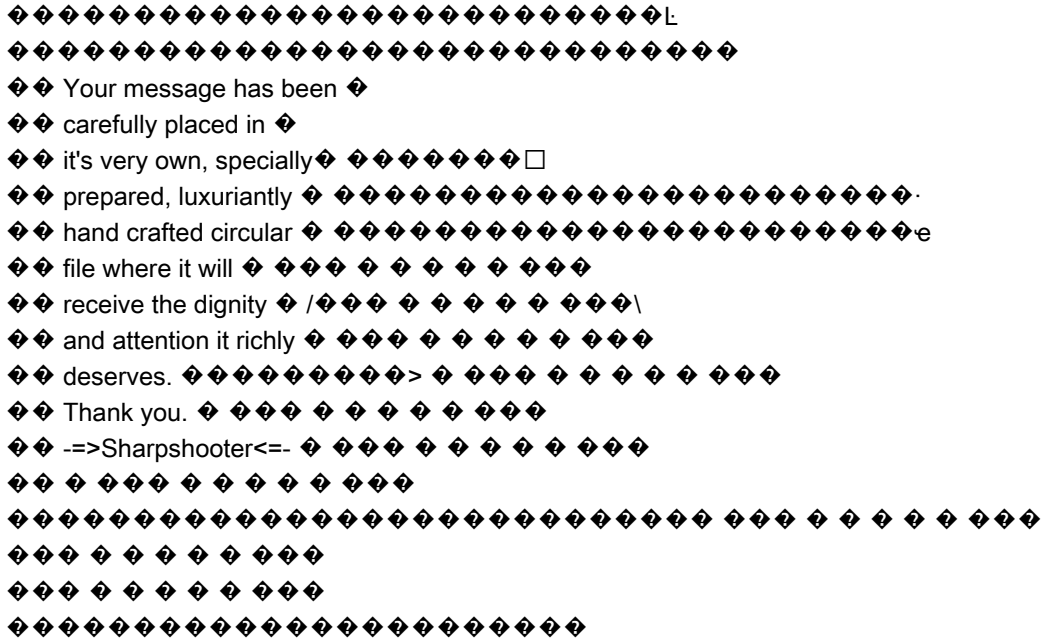
<raving looney posting deleted>

oh dear, after several months of peace after the departure of
Roger the Sad Sheppard, the sewers are backing up again.......

this is coming from a very pleased Atari Falcon user who has
been getting a LOT of use from his setup - and yet does not feel as
insecure as the above sad anorak who feels he has to come into this
forum and try to justify his purchase of a competing brand of
computer by claiming we're all idiots for using Atari/TOS computers.
Maybe if he stepped away from his computer screen and took a few
walks out in the street, and found himself a girlfriend, he'd maybe
calm down.

These are COMPUTERS we're using. Not toys. These are the tools
we prefer to use for their ease of use, excellent features,
continuing support by third-party developers in spite of being
dropped by the Tramiels (which is a blessing when you think of it),
and best of all, relatively free of the snake-oil and grandiose
pie-in-the-sky thinking that Mr. Bi66 6ates wishes to force on us as
the ONLY choice

To the above poster, I'd like to say this........



... That was the camel that broke my straw back - Fred Flintstone

>about 656f the downloaded news. I logged on again to repeat the
>process but the system assumed that the available news had benn
>received OK. Any ideas anyone ?

Expire everything with a time limit of zero so that its all gone, then
get a text editor to NNTP.DAT and manually change the time and date
back to the time you want the news to be fetched from. The first line
looks like this ...

news.demon.co.uk 960207 214418
^ ^ ^ ^ ^ ^
YYMMDD HHMMSS

So if you changed it to 000000 000000 you would get any old news from
new year at the beginning of the century :-)

(actually news can be expired on servers quite quickly but you should
usually be able to go back a fortnight)

Yes, it changes the Unix-type text files to DOS or TOS-type.
Each line in a UNIX text file end with a LF (linefeed).
For DOS that is return+linefeed.
There is another program, called DOS2UNIX.
I use them as UNIX2DOS.TTP and DOS2UNIX.TTP,e.g. if I have down-
loaded UNIX-type textfiles from the Internet, and I want to read
them by clicking on them.

:
: I am told that Papyrus does. Personally, for any *serious*
: presentations, I will probably stay with PageSTream; it is pretty

Papyrus is *very* good, although some German WPs like Signum! 4 and
Tempus Word Pro have more features. If one compares the feature lists,
Word 6 beats Papyrus with no problems at all. Word, like most PC prgs,
tries to do everything in one program. Still, Papyrus is much friendlier
to use, I think, fast, reliable, and makes excellent results. I prefer
Papyrus over Word, personally.

:
: TG> I will also need some info about fonts and printers which are
: TG> compatible with the ST. I currently use a dot matrix printer
: TG> but I need to upgrade to at least an ink jet so I can print
: TG> documents with decent quality.
:
: I use a HP DJ500C every day, and it is very close to a plug and play
: solution.

I have color DeskJet 660C. After finding good drivers, this printer
works about perfectly on my Falcon. What comes to fonts, you should
use NVDI 3 or 4 system extension; it accelerates Atari computers
enormously, and enables one to use high-quality scalablerfonts from
TrueType (used in PC- and Mac worlds) - and Speedo-families. With
NVDI 4 you can also use Windows 95- and Postscript Type 1 fonts.
Virtually all modern Atari applications support these fonts.

: TG> I currently use Marcel WP which is decent but doesn't really
: TG> compare to MS Word.

No, I agree ;-)...

: TG> Especially when everyone else gets to use these big beautiful
: TG> color monitors to do their work. I think I already have some
: TG> info in this but additional info is welcomed. I guess the
: TG> bottom line of this post is to find out if it is still worth
: TG> keeping my Atari or jumping ship and getting a PC. Money is a

: TG> big factor, so I will be comparing the cost of keeping my
: TG> Atari vs. selling it and buying a PC.

I'd say: stay with Atari (maybe a Falcon!) unless you have a *very*
good reason to change platform. If you think there are superior
programs available on other platforms, you're fooling yourself.
We have as good programs as anyone else - some perhaps even better..
Besides, though PCs are cheap, sexy, and colourful, one good friend
of mine (who has both a Falcon and a fast Win-95 PC) could tell you
something about life "behind the curtains"... He thinks, PC looks
very nice, and the games are great - but getting the system to work
reliably just takes far too much time.. He says: "I never knew how
much trouble a computer can create before I had this chance to use
PC daily. In some ways I love it, in others I just hate it! Besides
games and Netscape, life with my Falcon is easier..."

: 2) Buy a TT. Lots cheaper than you might think, very fast compared
: to an ST, runs a VGA monitor at 640x480x16 colors out of the box.

TT is nice; get one if you can! A good graphics card, and MagiC 4 as
operating system... yammy!!!

: 3) Buy a Falcon. More and better graphics than the TT, although it
: is a little slower for routine computer work.

A cheap FX-accelerator card turns a Falcon into a very nice computer
=) ! Subjectively, quite a fast one, too. FastRAM helps here a *lot*!
I love my Falcon, at least. (I do DTP, graphics, music and word pro-
cessing)

Greetings,
Tommi

2563. Where can I get STiK programms

How you export the files depends on the software you wrote them in. The best formats to export are Rich text format, or word perfect 4.0. There are are conversion programs to take files form 1st word to word 4.0. Word 6 for windows will import, ASCII text, RTF and all of the old word Perfect formats.RTF files from atari works some times need to be reformated to correct for different spacing in fonts. (best to use a true type font).

I hope this helps

1) I use Mintnet a) Because it is more stable , I don't remember a
crash on any pages .
2) Falcon 4.04 with Mint 1.12 (Would love to use Magx 4.0 but so far
there's no drivers .
3) When i'm in normal Tos about 1 out of every 20 .

P.S. Was talking with one of the developers of Oasis and version 2.0
is being Beta tested now and is slated to be released in 1 month .
No answer though if it will come with Spider their answer to the Web .
I hope it is so that we can get 1 software to do all our internet
needs !

Sounds neat!

I presume its just wired into the SCSI bus - so that anything the Link
outputs automatically gets parity added.

Would also be useful I supose for mixing 'parity on' only and 'parity off' only
devices on the same bus. The TT's built in SCSI seems to be able to do this
anyway.

:-)

STormtracker I'm sure is still available and exclusively from Goodmans PDL. I think its price is now around the 15 quid mark.
The programmers I haven't seen since a 1994 show but he was well into his Falcon (his name was David Oakley I think).

:> For C coding Pc's are as good as an Atari. But for assembly coding Atari's
:> (and Amiga's) are just the best.
:
:I don't agree !
:Atari's are better than PC in C programming too :

when talking about coding for a PC, you HAVE to specify an OS.

:- How many C lines do you use to open a window in Windows3.1 (or 95) ?

Ah, you are talking about PC's running windows3.1 (95)! PC users do
have a lot of choice which OS to run though. So be careful.

:- Is there any Windows3.1 library in GCC ?
:- Is there any public domain C compiler for Windows3.1 ?
:- Is there any public domain langage for Windows3.1 ?

doesn't matter, we were discussing differences in coding (in C) for PC
and Atari, we were not discussing whether the compilers are shareware or
not!

Anyway, I can only compare Atari GEM to linux (XFree86). The number of
lines to open a window is about the same (of course, there are many
ways to open a window in X). I find X a lot better (also as a coder)
than GEM.

I've got every copy of Atari World which I'll trade you for your 'vids'.
Atari World was mostly done in 1995 but this percentage will change as 1996 moves along.
I even have a copy of Issue 3 with pages 41/42 (ish) which I'm sure would be right up your alley.

:-)

Thats GCC for you.

> I have been having. It really chould be a lot better. Especially GCC,
> which is _really_ bad (Falcon with 4megs of memory and a hard drive).

Just make sure you get a lot more memory on your new platform. GCC still requires stacks of memory. Its not just an Atari thing.

> I want the features of MiNT, MultiTOS, GCC and Outside and I do not

Sounds like you just need more memory in general. If you are trying to run GCC under MTOS in 4Mb - then I'm not suprised you are angry. Outside is apparently not too helpful in these circumstances either. It doesn't really have enough memory to play with. Dump MTOS and use raw MiNT (with a shell). It works much better.

Roland.

If an individual Atari user doesn't reply, you might want to try either
of the 2 following Atari dealers who specialize in used inventory...

1) CeeJay Software 1-618-242-0405 6pm till 10pm CST
2) Computer Dungeon 1-708-547-7085 10am till 5pm CST

Used SF314's run about $40-45 at either place...and they both will give
you a warranty on their items...Good luck! :)

Not sure if this will help, but here goes...I'm using Oasis with my
local provider ('cause they don't support SLIP only PPP) but I can
still ftp, e-mail, etc,...Anyways, I couldn't get Oasis to recognize
their prompt strings either so I simply changed the script to "time"
everything and send in my account name and password after a certian
amount of time...Not sure if CAB/STIK uses that kind of script but if
you can then try that! Good luck! :)

Yep. I can tell you that my staff use Pagemaker, and for most purpose (except books perhaps), Pagestream is by far a better product IMHO. They use the office Atari (mega4 with t36 accelerator) in preference to Pagemaker and the MS stuff.

> There are several options:
> 1) Graphics card for your ST.

I have a VME Matrix Coco card for sale. Offers about 150UKP?

It does 800x600x256 (good) and 1024x768x16 (great) and a selection of virtual screen sizes (full page A4 for Pagestream).

This may be as daft as it sounds. I take it the idea is to get it to whoever in a format they can use.

Why not Mime or uu-encode it as a multipart document then they can rebuild it at their end - they must have some system for dealing with things that don't fit on one floppy?

>during the message _after_ the problem one. So all you have to do is load
>the batch file into a text editor & delete all messages up to and including
>the problem one. Not elegant, but more cost-effective than reloading all
>your news!

I missed the posting which led to the above reply. I have also suffered a few OASIS problems. The reason I missed the above posting was that after downloading the news items (over 900) the system stopped during the unbatching process with the message 'EXTERNAL ERROR CHECK OASIS INSTALLATION OK' When I clicked on OK the system exited OASIS and returned to the desktop. Upon checking for the BATCH.TXT file in the ARTICLES folder I found that it was not there and I lost about 656f the downloaded news. I logged on again to repeat the process but the system assumed that the available news had benn received OK.
Any ideas anyone ?

>eproms for my TT?

Yes I do own one, but, no I won't.

>If this is not breaking any laws or copyright...!

And _that's_ the reason for it.

Besides, it is people like you that go about asking 'innocent' questions
(where it is just plain obvious that it's f*cking illegal !) that make
the best of our developers turn their backs on ataris.

MagiC is the best software that was ever made for the Atari platform.
Some great German programmers did what Atari in Sunnyvale, despite all
their efforts(?), never accomplished; they finally gave the Atari a
real Operating System.

It's up there together with NVDI, APEX, MiNT, Calamus and Cubase.
It's thanks to programs like this that the Atari platform became so popular,
or they opened entirely new possibilities for our computers.
And these programs can compete with the best of other platforms' software.
Buy it and you won't regret it. It will be the best money you've ever spent.

I got that wrong, it should be comp.sys.atari.st@mail2news.demon.co.uk

>Just use the search and replace in just about every WP/Text editor to
>do a serch and replace (search for %(1 percent sign) and replace with
>%(2 percent signs)... and only do it on stuff you KNOW is going to
>get corrupted !!

I may have spent hours pouring over the source code to find the exact
cause but I'm going to have to admit to being a plonker - it never
occurred to me to use search and replace! (if I didn't have a hangover
I'd spend the next 5 minutes banging me head against a really solid
wall) :-)

Anything outgoing from NNTP goes through the same code, it's the %
which allows it to corrupt. The author is now aware of the bug.

The only time I've ever seen NOS bomb was when '%' was followed by
's' which makes it trundle off looking for a NUL. If you are lucky it
will find one before it bombs. I've deliberately not put the two
together in case someone quotes it!

>BTW: it'll be interesting to see how the above comes out (as I typed
>an extra percent sign in both cases !)...

Fine.

HELP!
I'm in the final stages of purchasing a US Robotics 14400 Sportster Vi
Voice modem but I need some software to drive the Voice / Fax part...
I've had a shot at using the demo version of CoMa 2.something and also
tried Connect Demo v2.46 but... neither of them accepted the US Robotics
modem as having voice capibilities.

If someone could suggest some software or post a configuration of CoMa
which works with it then that would be very much appreciated.

> I've heard different advice from different people. I thought that
> I could buy any SCSI drive and plug it into the back of my 1040STFM

This was more or less true - though newer SCSI drives on older Atari host adaptors can be a problem.

> via a suitable adapter (mine's a GE-SOFT). I seem to remember this

The GE-SOFT host adpators are one of the worst sort too. I tried for several hours to get 2 known working SCSI drives to work with one - but gave up. My ICD AdSCSI+ had no problems.

> I was informed that ones sold for PC's do not work with Atari

This is certainly *not* true. There is nothing special about the SCSI drives sold for use on the PC. Its true that most PC drives aren't SCSI anyway - but the ones which are can generally be made to work on the Atari.

> :-((Something to do with termination or parity. Lucky for

Many modern drives don't have a parity disable function - so this is probably where you came unstuck with the GE-SOFT host adaptor. An ICD Link2 or AdSCSI+ would probably have worked. Also you would have had to make sure the SCSI bus was properly terminated - and that the TERMPWR line was actually being supplied with power. This can often be done by changing a jumper on the drive.

Some of the very new drives also object to the lack of bus arbitration on most Atari SCSI buses. This is much harder to solve - but its not a huge problem at the moment.

> Just be careful

I'd agree with that though. Its certainly not as easy as it used to be.

:-)

Apologies that I can't help with the first problem but I too have seen
it happen, so I'm very interested to see if anyone can provide a
solution. As for the second, my SM124 does the same - playing the great
"Megaroids" is hell when the rocks break down into small pebbles which
become almost invisible on the SM124. I think that's how they're made -
don't they have some kind of phosphorous element in them which makes them
really nice (paper-like) to look at in the first place?

b> It's true that parity must be disabled on the HD you want to use
b> with your ST.

No. It depends on the host adapter you are using. ICD AdSCSI+ and Link2 (for instance) can handle parity whereas Supra cannot. It's usually best to get an HD on which parity can be disabled then it will not matter which host adapter you use.

b> I've heard that the new ICD host adapter "The Link 2" fixes this
b> problem.

Yes, along with some other h/a, it can handle the "parity" line.

b> Since I only have "The Link", I've made a parity generator myself
b> and it works fine. It's very simple, only two TTL IC: a 74LS181

Bad Mood is a crew which is developping a program which will be able to read .wad files (used by doom, heretic...). this seems to be really serious since 3D-rendering is realised (in DSP code) by someone from Black Scorpion Team (Apex Media). You can find a beta version of their program on the Web (search for "Bad Mood" with Net Search, I dont remember the adress).

I am not sure but if it is anything like the one I wrote a couple
years ago for Windows NT, it converts between UNIX and MSDOS text file
formats. Also, that is a popular name for a program on any OS that
does the same task. That would be my best guess.

Jerry,
It is a project to play Doom and Heretic WADs on the Atari Falcon.
I haven't yet got a WAD to try it out yet but it now includes
texture mapping from what I've heard and runs fairly quickly.
There are no enemies yet so it isn't a complete game (I believe)
and I also think that it can only play the original shareware
Doom WAD right now. There is also another person making a
Doom clone and that demo was called doom_f030.arj, I believe.
Look for it on an ftp site (I personally could not get the
program to unarj).
For more info on Bad Mood there is a Web site. I don't remember
the address, unfortunately, but it is possible to get there by
a couple of links from www.toad.net. I am sure someone else
will give you better help ;-).

> TG> but I need to upgrade to at least an ink jet so I can print
> TG> documents with decent quality.
I've been using Papyrus 4.0 (German) for a week now and I have to say I
just love it. With NVDI >= 3.0 you have all the font support you can dream
of and almost DTP-capabilty (multi column, pictures, free floating text
boxes and so on). You also have all the wordprocessing stuff and even you
have most of the functions of let's say Word for Windows it is still very
usable (I felt really at home after about 3hours, including tables and fancy
page setup).
Before I've been struggling with Wordplus 4.0 for about a year. It has most
of the functionality but I could never get to like it. The user interface just
wasn't well thought out.
If you have NVDI, printing is also no problem, I use an old Star NL 10 and
a HP Deskjet and they both produce good looking output, the Deskjet is quite
fast. Fonts are now problems, with NVDI you can have a access to all the
TrueType Fonts of the Apple and Microsoft World (the same is true for Speedo
GDOS which I never tested myself).
Papyrus alone can be run with 1Meg of RAM, if you use NVDI 2Meg are a must.
This could be your biggest problem, often it's cheaper to get a used MegaST or
a TT than putting in more RAM.

Hope this helps

>useful.

Hear hear! I think its getting out of hand when 'shareware' has printed
manuals, boxes, and you cannot do <anything> with the 'shareware version'.
This is NOT shareware, its a DEMO.

I think that as the market is shrinking, the former shareware authors
are turning comercial - this is leaving very little real shareware.
(although some of us refuse to hoist prices, and preduce boxes/printed
manuals etc.)

Of course, if no-one wants shareware anymore, then perhaps its right that
what was shareware is sold as comercial to get it extra coverage...

dave wrote:
> Thanks for that. I use HDDRIVER. What boot config parameters are there for the
> TT and how do I set them?

I would advise getting HDDRIVER version 4. In v4's HDDRCONF (HDDRUTIL? I forget) there are options to set the OS to use when booting. Choices are TOS,MagiC,Linux, NetBSD and Atari SysV. There's another option to set the SCSI ID of the TT, which is used for bus arbitration. All these settings are in the right hand menu, just play around with HDDRwhatever and find them...

> --
Ok, here's a quick translation. Theres just one word I didn't
understand, but if you don't use HDDRIVER it doesn't matter.
And I think you are able to figure out what it should mean.

BOOTCONF makes it possible to configure the bootparameters in the TT and the
Falcon030, as they are located in non volatile RAM. For more information see
ST Computer 2/92.
These settings are activated after power-on or reset. Though the videoparameters
are overwritten by NEWDESK.INF when it is loaded. If the boot delay is set to
less than 8 seconds, the Falcon skips the memorytest and boots automatically
as soon as the HD is ready.
On the TT, only the settings for bootpreferences and SCSI-ID are meaningful.
The SCSI-ID is just (ausgewertet=[used?|evaluated?]) when you use a hard disk
driver which supports bus arbitration, e.g. HDDRIVER Version 3.5 and upwards.

Good luck with the configuring...

/HUGO.

I've just found on :

http://web.cnam.fr/Comp/Atari/Index_Falcon_Games.html
OR ftp.cnam.fr ...

a brilliant preview of a game about Willie the Adventurer.

Its Falcon only but has the best use of colours and animation and parallax scrolling you'll ever see ! On both RGB and VGA ...
Its alot better than some Jagur stuff I've seen !

It also uses the Joypads to full effect with everything controlled from them (including the Option button !)

It looks like it will be an excellent game but have a look at it !!!

Bye for now,
Simon

Do you have a drawing of this circuit somewhere? I'm sure many people
here would benefit from something like that.

I have Sublogic Flight Simulator for Atari St along with
box, documentation and 2 scenery disks #7 and #11
for sale for $15.00 + 3.00 shipping. I am going to post other
lists of software I have for sale anywhere for $5.00 on up
and if you get anymore titles there is only a $3.00 total
shipping charge.
Thanks royler@cnmnet.com Robert Oyler

It is possible to run different Systems on one platform at the same Time.
Just try the Mach-Kernel.
There is an BSD-Programm for it and also a DOS-Programm.
They are like the original OS on the original Platform to the Applications, and
they are Applications to the Kernel.
Also Gnu HURD is going to be a set of Mach Applications.
Just think of that possibility...

Christof

2620. Re: Bad Mood

> is this shareware, freeware, Demo or Commercial. And where do I get It? Thanks
> to anyone replying..
>
>

Bad Mood is a FREEWARE game that is currently being written by quite a few
people across the Internet. Its primary aim is to get a running version to work
on the Falcon030 with 4 Mb.
But it runs on the FX Cards etc. and also the AfterBurner040 accelerator.

The current version is still in the alpha stages and can be FTP'd or WWW'd from :

http://rand.thn.htu.se/~johan/bad_mood.html
or
ftp on rand.thn.htu.se/pub/BAD_MOOD/bm18a.lzh

This version is release 1.8 and has a full working 'world' with bitmaps mapped
to all surfaces just like the 'real' doom !

The game is far from finished at the moment but progress is going well.

You can join the mailing list, to offer ideas/info on monster Artificial
Intelligence etc.
Also if you're a demo coder / game designer and would like to join in or help
out then have a look !
Even if you don't have a Falcon yet then you can still read and dream :-)

To subscribe, e-mail with the subject line as: subscribe
and send it to: bad_mood-request@rand.thn.htu.se

Simple eh ??

Alternatively visit my Web Pages !

Bye for now,
Simon

>Then you should know better by your age.
Oh dear. I can only assume from that, that you're exempting yourself from "knowing better" and therefore not of an age to do so yet. Sorry, I thought I was talking to someone older.
In that case, you've some way to go to achieving a social maturity yet, but I will ask you to read the messages again (try to notice the smilies this time and not those imaginary dragons you perceive) and endeavour to re-think your social interactional skills. Being less truculent and sensitive will make your dealings with others so much easier for you or for the rest of us.

>Wanna bet...
No, you're quite right, you win. After all, nobody could possibly have more experience or qualifications than you.

>And I stand by my points, credentials and views.
Of course you do, they're not in dispute and I wouldn't expect anything less from you. What is your problem, is your truculent and arrogant adolescent manner.

Exactly the same here - it might go on to flickering the whole picture
from side to side very slightly - just enough to leave you wondering
why you've got a headache until it gets bad enough to notice.

>I seem to remember reading that there's an infamous fault happens on

Mine has done this since new. I sent it back under guarantee but it
came back exactly the same. I never got round to taking it further but
it has always been so bad that if there is just a single white
character on the screen you can only just see it, then the screen
fills and I'm blinded.

>Hope someone can answer this one please!

Sorry, it's not the answers you want :-(

>correctly with the Atari driver (AHDI 6.06) ?
>Thanks, Eddy.

Yes it works very well but not with AHDI 6.06. The reason for this is
that the SCSI bus id check stops when a space is found. The ZIP can be
switched between SCSI id 5 or 7 so my Falcon would find my external
drive on id 0 and not look any further.

HiSoft here in the UK supplied a patched version with my drive which
checks all 7 id's at bootup.

I believe HDDriver or SCSI Tools also will work fine.

Cheers

Ed.

So, what's the deal? No ST users out there? doubtful.

I was just checking out comp.binaries.atari.st and there is nothing there.

If they're not there, then where?

As an Atari user since 1980, (first a 400, then 130XE, then 520, 1040, Mega 2) and a current Windoews PC owner (I'll never lose my love for the Fuji), I know that Atari users are some of the most devout hacks on the planet.

Yet, there seems to be a real lag of what's available out there compared to other "dinosaur platforms." Why? We all know the Atari ran circles around CBM, Apple, TRASH-80, and other 8-bit platforms. And the ST held its own just great against its competition. Even UMich and its mirrors have a pale compilation of what's really out there!

Let's keep this platform alive, even if Atari won't.

> nonsense. A complete 486dx2/66 (gus or wavetable soundcard, networkcard,
> 2MB svga video card, 8Mb, 540Mb hard, 15" svga monitor) you can buy for

What make of network card though , what make of video card and of course the
cat amoung the pidgeon (esp in combo with the network card) where is the SCSI
card ??? ... all these things NEED to be asked else you will be getting grief
if you want to do anything more than running the pre-installed applications.

I don't think there can be many Software suport people who have not had the
" this is unsupported hardware " response from MS (worst but by no means the
only culprit) when a software problem is encountered.

> about NLG2000 (=US$1300). No hassle for installation, it comes as a
> complete setup.

a complete DOS/WINDOWS setup I think you mean .. stray off that path and you
better be prepared for a fair to large amount of problems with configuring and
having to call support numbers and check before hand if your various cards support

Your sig for example suggests you use Linux on your PC ?? Would you for example
recommend a very popular pre-installed video card manufacturerer ..

Not too mention that most PCs are sold on the basis that you will NOT stray off
usually pre-installed DOS/WINDOWS thing ... start putting linux on it and you
are no longer in the realms of "complete and supported system" and back into the
arms of end user support only ...

Well if it still does all you want it too do then my thoughts are why change
it .. the ST still hold a good 2nd hand price in the music comunity since
despite its complete lack of horsepower and grphic features if it a simple
and adaquate tool for midi sequencing.

> I guess the bottom line of this post is to find out if it is still worth
> keeping my Atari or jumping ship and getting a PC. Money is a big factor,
> so I will be comparing the cost of keeping my Atari vs. selling it and
> buying a PC.

What about adding a Falcon ?? Despite its cons , there are a number of pros
especially for the sort of tasks you wish to put it too. It retains the
useability of the ST but with a bit more clout and some extra hardware
to give you more capable system ... e.g .digital audio.

just a thought :-)

it probably does something like

```
$ sed 's/$/^M//g' < unixfile > dosfile
```

i.e. it converts Unix linebreaks (LF) to DOS/TOS linebreaks (CRLF).

Have you looked at the Reflex card from Titan Designs? I think it may
only do something like 800x600-ish on an SM124: I have a 144 and get
1024x750-odd. X11 looks great. :)

>
>I've had this problem when I ran CAB before enabling STiK. If STiK is
>enabled and connected before running CAB, this problem should go away.

OK this is kinda bull (sorry) I figured out why cab gives you this error.
in the disk cash settings the keep meg free option will cause this.
i.e. I noticed this message every time when I had disk cache set to 8 meg
and keep free set to 8 meg and my hard disk only had 8 meg available to begin
with. I set the keep free to 1 meg and bingo I never saw this message again!

try it you will see the error
see how much free space you have on the cab partition and set the keep free
option to that. You will get this message everytime you are online with stik.

Hope this helps.

This question seems to come up fairly regularly. You can connect to
an ethernet using a de600 pocket adaptor and a simple interface card.
More sophisticated - and more expensive - cards are available for the
TT and Mega.

But although you can physically connect to the network you can't
use netware services as the protocols used are proprietary. TCP/IP
you can use though, and it would probably be possible to port samba
to use LAN manager drives.

On fidonet (and other networks using the same protcols) the word
netmail is used for private mail, to distinguish it from public
messages (sometimes called echomail).

The word comes from some bulletin boards where you had to choose
different menu options for local mail and network mail.

So what he means is a private email, not a message in the newsgroup.

our company would be interested in picking up an ST.

if anybody was thinking of getting rid of theirs, here's what we want:

520 or 1040 ST, preferably with one meg or more, and mouse
original documents
color monitor (and assuming it has a video card)

we can offer $40-75 U.S. or $60-90 Canadian, depending on the system.

we do not need any printer, modem, or other peripherals, just a
working system.

if you have a system for sale, please e-mail at uci@infobahnos.com .

thanks

>MintNet or some other TCP/IP-stuff on Atari. That _should_ work.

No it won't. Although you will then have a working TCP/IP network, you
will not be able to mount any Netware volumes etc, as the higher level
Netware protocols such as those for file and printer sharing are
proprietary and documentation is only available under an nda.

Source record: 151012

I haven't seen it advertised anywhere other than Toad; sorry. I own one and DO like it's 'looks' well enough. From the front, it basically looks like the old standard PC box and seems sturdy enough to place a monitor on top, although I don't use it that way. I like the workmanship of the unit itself and had no problems putting it together with my Falcon. It allows for the mounting of TWO fullsize/height spinners, with enough room left over for a proper (second) power supply. ..although I suppose you could just get a beefier replacement (main) one from Best or somewhere. It supplies mounting holes front and rear for all of the SCSI and AC cabling for the upper compartment along with a place for another (second) power switch for the 'upstairs room' the unit provides you. The cool thing (to me) about the 'Freekeys' keyboard part of it, was that all I had to do was buy a female/female MIDI extender, and now I can use 16 or 32 foot standard MIDI cables to move the keyboard and mouse/joystik FAR away..... handy for the studio. ....can you tell I like it? 8^)

2658. Problems PKS-editor/Calamus_SL

From: Martin.Byttebier@ping.be
Message-ID: <823886488_OASIS_@ping.be>
Source record: 151013

Hello,

This morning when I was doing some DTP work with Calamus SL I ran to a rather strange problem. I tried to edit the text I was working with, but the PKS editor refused to open the textframe and gave me the following warning
Format fault Control-code #0X2o
Can someone tells me what this message means and what I can do to avoid this problem in the future?
I'm not sure but I think that something inside the text caused this problem. Is this possible?
This nuisssance only occurs with Calamus SL. Editing the same ASCII-file inside Calamus 1.09N caused no problems at all.

Thanks in advance
Martin

I have owned two SM124s. Neither acted like this at all. Both of
them died of 'increasing the raster size' disease; both were fixed.

One of them is still on my wife's desk (in the USA).

Are the problems mentioned by these folks all on 50 Hz power systems? Might be a clue.

... When in doubt, use a bigger hammer...

JC> Subject: new to this
JC> group Hi all, I am new to this group and was wondering if the
JC> atari st is still supported and how/where can I get software.

Well, you can start by ignoring Atari Corp itself. This is my vital
resource list:
comp.sys.atari.st
Toad Computers - commercial hard and software. Also ftp and www.
ATY Computers
STeve's SofTware
ST Informer magazine
Gribnif
Mountain Software
etc, etc, etc. I don't mean to leave anybody out.
and a small host of other people, most of whom hang out on:
comp.sys.atari.st

One of the signs displayed on the old 'MASH' tv show was: 'Best Care
Anywhere'. Maybe we should adopt that for our own.

"The Poor Deluded Soul" - tderrick@acpu.com

No, not to my knowledge.

>hey, btw, anyone have an opinion on whether it is too ugly or what?
Dissuade
>me from my investment! :)

After fooling around with a tower case for a while, I decided to
try out the DeskTopper. I have 3 3.5" hard disk and a 5" CD Rom drive
mounted inside. I removed the mainboard from a PC power supply and
fit it inside as well. There was enough room left to mount the
keyboard gizzmo inside to. There is still room left yet for another
hard disk. I had to make a templet to drill all of the mounting holes.
There are plenty of outlet cutouts in the rear for cables and such.
I left my floppy mounted inside the Falcon. (It uses the lower
section of the Falcon for a base). There is plenty of room under
the unit to clear a Mighty Sonic card full of ram and an Expose
card on top of that. You could even install another 3.5" hard disk
on the Falcon motherboard with out problems now.

You first impression is going to be that it is kinda of wimpy.
After it is assembled and mounted it is a pretty sturdy set-up.
If you have long enough cables, it can be set beside your machine
while operating/trouble shooting, kind of nice.

One final thing. Once I painted it black, I kinda have accepted its
apearance. Dumb, right ?

I'm not much of a technoid on this subject, but STik needs to have
added to it's dialer script <precisely> what your server prompts are.
Log on with a terminal program and copy down all asci text that
comes up, words, spaces, periods ect.... Hope this helps.

You're probably OK here actually. If it's a cheap PC they'll all be generic stuff
based on exactly the same chipsets as all the other cheap boards, and so
compatibility shouldn't be a problem.

>Your sig for example suggests you use Linux on your PC ?? Would you for example
>recommend a very popular pre-installed video card manufacturerer ..
>Diamond Stealth <G>

Actually I would now. Although Diamond only release the information under an NDA,
and so don't allow source code to be distributed, they do allow a binary to be
distributed to set the clock chip, and the latest XFree86 has an option to call
an external program to set the clock chip, so you can use most Diamond cards now.
And Diamond, almost alone among PC video card manufacturers, are sponsors of the
XFree86 project.

>That answer is kind of vague. Where are the drivers for the external
>ethernet connection?

MiNT-net. Unlike STiK it isn't just a dial-up internet stack, but a proper
TCP/IP layer like unix uses. It comes with a de* driver and apparently
works very well with ethernet connections using it.

All the standard unix networking software is available, including nfs
(although many people have had problems getting nfs to work correctly).

> can i plug my 520 ST to a novell netware network ?
You may install Novell Netware + RS232 expansion card on your server. You then may install the TCP/IP drivers for Novell Netware using the RS 232 card. (The IPX or whatever drivers should be still installed on your netware server to serve the ethernet connections!) Then you may install MintNet or some other TCP/IP-stuff on Atari. That _should_ work.

No, the STe can also.

>does it come with the necessary adaptors/ cables to do so? how clear
>is the picture?
>

You should just need a standard coax cable from the ST* to TV. If you TV will support it, you can connect from the monitor port to a SCART on the TV. This will provide a better picture, though I believe either method will only support low and med rez. High rez needs a device which supports 72Hz.

I would say either is good enough for casual use or games, but serious use really needs a monitor, unless you don't value you eyesight ;-)

Andy.

No, there is no switch of any kind. IDE cannot be disabled by software
except with patching TOS. TOS always checks for IDE during booting.

Why not just replace the stock IDE drive with a better one? Might be
cheaper, and IDE drives are pretty fast anymore; unless you have a need
for D2D or other drive-intensive applications. I put a 340mb drive in my
system, and love it. It's not internal, and I haven't built a case or
anything, but it works fine for me...

Jerry Fredrickson <freddy@thor.net> wrote:
>I have seen talk about a program called Bad Mood is this a clone of Doom?

BAD MOOD will be a kind of DOOM clone.
The current version reads DOOM, DOOM 2 and Heretic WADs and lets you
walk around in them. Only two texture maps are used at the moment, but
all walls and floors/ceilings are mapped with those.

There are no monsters, weapons or interactions with the environment at
the moment.

Current versions of BAD MOOD only run on Falcons. Both the DSP and the
true colour graphics mode are important for the performance.
It's quite possible that there'll be versions for other powerful Atari
compatible computers with useful graphics modes as well, eventually.

> Also is this shareware, freeware, Demo or Commercial.

It's FreeWare and possibly GPL. The latter has not been decided, but
sources are meant to be available.

> And where do I get It?

Take a look below.

Source record: 151036

I thought I might upload some more of my naff little Gem utilities.
This time I thought I'd plonk them in comp.binaries.atari.st instead
of having people email me.

If they don't work on your system then tough :-)

SDUSEMEM

Allows all but a specified amount of memory to be temporarily gobbled
up - useful for testing your programs deal with memory exhaustion
correctly. It is a bit pointless unless you can multitask.

SDTIDYUP

If you're like me and just use printf() to dump debugging information
on the desktop then it soon scrolls away. Of course you can click on
the MagiC "tidyup" but you can guarantee the mouse has vanished as
well. Apart from being able to force the mouse back on and do a screen
redraw, it can also restore the palette and turn the text cursor off
if you want. Should run on anything but pretty useless unless you have
a system that can launch it via a keypress, and I haven't the foggiest
what will happen to non ST palettes.

If there's any interest then say so here - I might even spend 30
seconds documenting them.

I'll try again. Sorry Atari discontinued the ST. Forget a used one too! The after market parts prices are hard to get and way, way, way overpriced!! The floppy drive on my ST finally gave out after five years of abuse and I took it in to the only place in Southern CA to get another for $100 plus $60 to install it(the case has to be modified now). Well after waiting four weeks for their supplier to assemble it, it turned out to be a dud! Too bad really because its a good machine that can be upgraded like a funny car. Atari must have had a CEO(possibly a relative of a former Apple CEO) that really had his head jammed all the way up his ass. I'm a DOS man now.

Former Atari hardware victim,

Sorry, but you guys are way off. Within a year you'll start
seeing new programs written in JAVA, a cross-platform language.
New OS, word processors, any damn thing you can dream up, all
cross platform, ALL! Keep an eye open for it, here it comes!!

2685. Re: CAB (STiK/MiNT Net) Survey

Newsgroup: comp.sys.atari.st
Date: 1996-02-08 00:00:00 UTC
From: ackerman.29@postbox.acs.ohio-state.edu
Message-ID: <ackerman.29-0802961455260001@gb107samac.acs.ohio-state.edu>
Source record: 151040

Well what I was expecting to find (hoping maybe) didn't appear. It's possible I didn't have a large enough sample to really determine it.

However I'm still condensing and boiling down the replies. Here is a quick run down of what I received:
(Note this assumptions are based entirely on the responses I received)

1. A majority of the people using CAB are using STiK to connect.

2. Most people are routinely using at least two different operating
systems.

3. I should have had another category between often and rarely ;)

4. In general among similar user types crashes seem to occur about as often under each. (Note: I did get two responses saying no crashes under MiNT Net and 1 of no crashes under STiK).

I was expecting to find one or more of the OS's that seemed in general to minimize the problems with CAB. However I did not find this. I will try to prepare a better presentation of the responses I got. The data is kind of confusing though just because of point 2 above.

What I surmise. Please don't read too much into this.

1. Most people who responded with rarely bombs or never bombs are people who are fairly well versed with their systems. By this I guess I could better say that in general they program to some extent. How does this relate to anything other than insulting people? I really don't mean to, anyway here is the synopsis of this.

Several people commented on assorted configuration or setup problems that once resolved reduced the crashes to a minimum. (Also note those who stated never bombs or rarely bombs, often could point to one or two problems the program had)

Here is a sysnopsis of things they point out:

a. Make certain your cache sizes match reality. You can't have an 8 meg cache on a drive with 4 megs free.

b. Cab still does not handle some options attempting to force it to do so can cause crashes. (Newsgroups, gopher etc.) [Note. This would actually be the CAB.OVL]

c. Attempting to use items in the program you haven't defined (HOTLIST, View SOURCE) can cause crashes.

d. CAB seems to die on CERN errors. (Bad URL)

e. If the network is bogged down. Partial files can occur. This causes problems with CAB. [Note: I really don't think this has much to do with either MiNT Net or STiK, but more with providers with poor setups - of course I could be wrong]

2. Peoples opinions about how often a program crashes are very personal. 1-3 crashes an hour during heavy use, how would you rate that. Often? Rare?

3. CAB seems to be most stable under AES4.1 and MiNT 1.12.4. However as AES4.1 won't ever see the light of day, hopefully one of the replacement AES's will fill the void.

4. CAB seems to run on almost every version of TOS. I did get a fairly good representation of that. The amount of crashes may vary but there is at least 1 person in the world running CAB on the following TOS's.

1.0
1.04
1.62
2.06
3.06
4.02
4.04

If you have one of these versions of TOS and no luck with CAB, I suggest you post a message to the newsgroup. There is help out there.

Well that's what I've found so far. Hope I didn't anger anyone and maybe helped some.

Thanks to everyone who helped with this.

A really old demo of HTML Browser. I don't know if anything ever became of it or not. Not really much competition with CAB, at least not at the stage of this beta.

I put it up mainly just for the people like me, who want to have everything, even if it doesn't work;) Really you should see my computer room at home ;)

>As I plan to buy a ZIP drive for my Falcon, I'd like to be sure that
>it works on a Falcon. Does anyone here use one, and does it work

My Zip works nice with my F030 and a smal Powerbook 150.
Look at this:
ID 1 ID 6
Falcon DPS31080 XM4101
#######--------########---SCSI-BUS-------########---T externalTerminator

Or:
Zip ID5 and Term. ON
" " " " " -----#####

Also for the PowerBook:

Mac Zip with ID5 an Term. ON
#######----SCSI-BUS----#####

This works fine with both Systems.
Only i have to format my Disks on the current System.

>correctly with the Atari driver (AHDI 6.06) ?

AHDI can't support the Zip! (And is very slow too)
Got SCSI-Tools 4.xx or HDDriver 4.6
You can found some Demos of HDDriver on any Server with Files for "Atari"

Send a Mail to Uwe Seimet@KL.maus.de (Autor of HDDriver) ;-)

regards, Robert

On Thu, 8 Feb 1996, Michael Grove wrote:

The problem with STiK is that it is not really a finished program. It really constitutes nothing more than a MoDeM-Connect Subroutine that has been hooked into CAB as Browser and CAB, being in ACC mode, should be written so that it will translate data bi-directionally with ANY Terminal Program That allows for this type of transfer. In other words, CAB should allow for data feed from programs like MTerm or FLASH II.

STiK should have some sort of viable interface that allows for a DO File type of configuration. Most ATARI programs these days are student projects being done for CS credit at various institutions of higher learning around the world. Rarely do these folk follow up and improve their code once they have gotten their grade!

Some use the basic concept as a platform to get them thru several terms and hense, the result being increasingly sophisticated pd versions. The really quality work comes once the version number gets up to about 3.5 - this usually indicates a 2nd term/3rd year or 4th year project and by then the program has become Shareware at the commercial level with a decent interface and bug-free functions.

Now come the flames!

Yet it cannot replace the Operating System, because it has to co-exist
with it (as you say it is illegal to place it on an EPROM)

>Buy it and you won't regret it. It will be the best money you've ever spent.

Perhaps he already has - just wants to avoid the extra memory overhead/time
because its being loaded into ram from disk rather than being on (EP)ROM.

I think most everyone who is not a hardcase research programmer agrees,
but nobody taking care of business pays heed!

STANDARDIZATION was one of the big buggaboos of the industrial
revolution! It is a great conmcept - within the confines of your own
factory (or intellectual ecosystem), but we cannot have the competition
making parts for our product, can we? And we cannot have interprizing
consumers repairing last years' model with the ruins of this years'
model, either!

The compression schemes of .z, .tz, .gz, tar, etc., are 'minor'
improvements over the earlier .ARC, .LHA, .LZH, and .ZIP or even .Z
formats, but they still are related - using kindred methodology and
algorithms that grew out of each other. They should have been done in
such a way as to be backwardly compatable. Instead of folding back into
each other, they've ran off in different directions!

The same holds true for all filetypes - especially the graphics. At
least there are reliable converters for most graphics because, with
graphics, as with text, the data content originates as raw code streams.

Compressed and encoded data does not do that directly.

Anyway, this could easily turn into a term thesis, so I'll leave it
here! When all the pros and cons are sorted out, the rational thing to
do for the average USER is to get onto the mainstream bandwagon and
acquire a 486 or better Intel Machine with a minimum of Windows 2.0, load
it up with the desired commonplace software, then run with it!

Of course, that doesn't work for most of us who have a large investment
in ATARI and no resources with which to replace it <G> ...

2704. NOS & netcom ISP

Newsgroup: comp.sys.atari.st
Date: 1996-02-08 00:00:00 UTC
From: rwhit@edenbbs.com
Message-ID: <823909704_OASIS_@edenbbs.com>
Source record: 151059

Man I cant believe it!

Here I am on a bbs ISP and can do slip fine
I was going to change to netcom as my ISP for cost savings
I signed up an sheeesh I can get slip, PPP or STik to work with them

Has anyone out there got NOS or STiK to work with Netcom?
If so please tell me what ya did to get it working

I called there support number and got an idiot that told me they do
not support anything but netcruser for a slip or PPP connection

The reccomended I get a shell account and run TIA or SLiRP
man I can believe it.

is anyone using netcom and a shell account with STiK?

HELP :-0

From: magic@mtu.edu
Message-ID: <4feffd$pi0@kirchhoff1.ee>
Source record: 151060

Howdy,

I Have Calamus SL and a bunch of PD font disks from BRE. Calamus
SL will not allow me to use all of the fonts. It pops up a message that
the fonts are not serialized to my copy of Calamus. Is there any way to
edit the fonts (Since they are PD) so that they will work with Calamus SL.

Thanks in Advance

-Kev

To: hsideras@mettav.demon.co.uk
Hi All,

Does anybody want to sell me his TOS 1.06 (or any other STE TOS) ?
Lots of people have upgraded their STE to TOS 2.06, so lots of people
must have TOS 1.06 lying around...
Please leave an e-mail,

Etwald Goes

Yup, that's about right.

Without the extra colours and without the need for getting a new monitor,
Overscan is an option for STFM's and Mega ST's for a reasonable price.

p> supply you with a dictionary file.

Must've missed this message... yup it's just a matter of getting a new
Spelling.dic file.

Alternatively SPELLONE.PRG will work, but you're unlikely to find it with a
very large dictionary (there's only 14000 words in the one I have) which is
held as a straight ASCII file, so it's quite large and would take ages to
update to something useful. Has anyone got a large *reliable* word list that
could be added to it?

p> I don't know that there is a thesaurus file, although I think there is
p> an ACC version floating around somewhere ??

The only PD/SW ones I've heard of have been very poor. See if someone around
has the old commercial K-Roget to sell second hand - that's what I use.

This garbled offering from tderrick@acpu.com to All was spewed forth...

Hello tderrick@acpu.com...

HT>> the trashcan? If this is so it can be potentially dangerous
HT>> for a Mac/ex-Mac user to try out an ST- because he/she will
HT>> ofcourse delete the whole disk if this is done!! (unless the
HT>> disk is write protected ofcourse). Correct me if I'm wrong-
t> Absolutely correct. Steve Jobs has been asked about this a few

Are you sure that it is correct? AFAIK, if you try and drag a disk icon to the trash-can on ST/E it says "This is not possible... To delete a disk use the format option in the File menu" or something like that. Therefore there is no danger of a Mac user wiping the disk if he drags the icon to the trashcan by mistake..... even if all the warning options have been switched off and the disk is write-enabled!! :|

Hello dpj@delphi.com...

d> another and exchanging mail? What other networking support is there;
d> I heard FidoNET is a possibility?

Yeah... that is probably the main advantage of using RatSoft over Michtron...
the ability to link with Fidonet (a PC network) and the various Atari
networks like NeST, Atarinet, Turbonet, FNet etc... :)

If you do get linked into Fidonet compatable networks, then make sure that
you carry the NeST network... it is by far the best network in the world for
Atari discussions... /MUCH/ better than even the internet!!.. and it is
totally free... apart from the cost of the phone call of course <g>

I have owned two SM124s. Neither acted like this at all. Both of
them died of 'increasing the raster size' disease; both were fixed.

One of them is still on my wife's desk (in the USA).

Are the problems mentioned by these folks all on 50 Hz power systems? Might be a clue.

2721. FS: TT with Epson Color Scanner

Newsgroup: comp.sys.atari.st
Date: 1996-02-08 00:00:00 UTC
From: marric@usa1.com
Message-ID: <marric-0802961010240001@wmn1-94.usa1.com>
Source record: 151076

I have a TT for sale with an Epson 24-bit color scanner for sale and
Retouche CD that work together as a graphics workstation.

- Atari TT030
32 mhz 68030 Motorola Processor
16 megabytes TT RAM
4 megabytes ST RAM
50 megabyte internal hard disk
1.44 megabyte High Density Floppy
Installed with Matrix Graphics Board for use with Retouche CD and
second VGA monitor
- Epson 24-bit flatbed color scanner connected via parallel port
- Atari PTC1426 VGA Monitor

Software included:
- Retouche CD (formerly Retouce Pro)
- Matrix color driver for Retouche CD
- Retouche Epson GT Scan 4000/6000 software for scanning within Retouche
- GT-SCAN 3 scanning software

Asking $1295 for the complete package.
Would like to sell as one workstation, but I'm open to splitting it
between the scanner and the TT. The scanner is connected through the
parallel port, so it could be also used on a PC with the proper software.

E-mail me if interested. Thanks.

Hmm.. daddy let little Davie on the computer again.. bad Davie!

And, just so little Davie can learn something from this, note: On any
other platform, a 16-track, 8-output, integrated MIDI and hard disk
recording would cost around 8K. My Atari Falcon with everything I need
cost less than half that.

So maybe now little Davie has learned something? Nah..

2723. Blow up FX board

F O R S A L E

P L U G N' P L A Y
H A R D D R I V E S E T U P !

50mb Seagate hard drive
44mb Syquest removable hard drive with (see below)
(5) 44mb Syquest carts
AdSCSI Plus host adapter
DMA cable and software
Case, fan, and power supply

All Fully cabled and ready to go! It's a Plug N' Play situation!

The Seagate and/or Syquest can easily be replaced with a larger drive.
Power switches on back and front for convience.

I cannot swear to it, but from the looks of it, a manual, and how
nicely it was all put together, I would say this setup was put together
by TOAD Computers.

Asking Price: $300 + Shipping

*** Price is Negotiable *** Price is Negotiable ***
SO MAKE AN OFFER!

Hi all,
We have a bank of 16 1040STe's at school and I need to find out how I
can network them using one of the computers as a server. What hardware
and software do we need and how do we connect it. Oh yes, and where
can we get the required bits from?
Thanks in advance.

Well, DUftp runs under XaAES (at least on my machine) but CAB won't play
at the moment - maybe next week ?

Craig.

2729. Modem AT settings (14.4K USR sportster) with RSVE?

Newsgroup: comp.sys.atari.st
Date: 1996-02-08 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <311a2ba686e5f5@sn.no>
Source record: 151084

I'm a little confused as what settings my 14400 baud modem should be set to as someone told me that even with a 14.4K modem I'd get some speed increase with RSVE (which I've installed together with drving.prg and mfp.prg in Auto/).

I've tried messing around with the AT settings, but it's really just a load of guesswork. I'm using "Connect" and have set the modem port speed to 38400 baud.
As for the AT settings I'd like some comments on the following.
The defaults (which I've got it set to) are marked with '*' characters:

at +:

y0 power on/reset default f1, hardware flow control template settings on NVRAM

&a3 enable/display ARQ codes: protocol indicators added- LAPM/MNP/None (error control) and V42bis/MNP5

&b1 fixed serial port rate

** (I've tried setting this to &b0 "variable, follows connection rate", but it seems to give mixed or random results- sometimes I get "trash" on the screen instead of normal characters upon connect)

&c1 normal Carrier Detect (CD) operations

&d2 normal Data Terminal Ready (DTR) operations

&f1 hardware flow control template

&g2 1800Hz guard tone

&h1 hardware flow control, clear to send (CTS)

&i0 software flow control disabled

&k1 data compression auto enable/disable

&m4 error control (ARQ) normal/ARQ

&n0 data rate, phone line interface: variable rate

&r2 received data to computer only on Request To Send (RTS)

&s0 Data Set Ready (DSR) override, always on

>Any info welcome...
>--
>dave
>
I'm finally got DNS lookups working. I had to use the same command line
shown above, use slirp-1.0c, and in the case of my ISP users must initially
login to a
VAX account then rlogin or telnet over to the unix server. Changing the
command from "rlogin host" to "rlogin /eight_bit host" got things
moving. If you are using a unix flavor of rlogin then it would be
"rlogin -8 host". It seems that a clean eight bit connection is mandatory.

Now I've just got to get CAB to quit giving me two bombs when I bbring it
up with Stik running.

For Dave,

From the slirp-1.0c README file...
>What is Slirp?
>==============
>
>Slirp is a TCP/IP emulator which turns an ordinary shell account into a
>(C)SLIP/PPP account. This allows shell users to use all the funky Internet
>applications like Netscape, Mosaic, CUSeeMe, etc.

Or CAB

I got my copy of slirp from "ftp://peak.usa1.com/pub/slirp/".

Enjoy and thanks to everyone who e-mailed me hints.

Lee

From: rjb@xs4all.nl
Message-ID: <4fcmjl$9ou@news.xs4all.nl>
Source record: 151089

Paul Squires <pns@soc.unl.ac.uk> writes:

> I have recently uploaded a program called UNIX2DOS... the title is
>interesting, but I have no idea what it does! Does anyone have any
>information on this tiny but presumably necessary program?

Well, it doesn't convert UNIX into D*S, like you would expect
regarding this stupid title. UNIX2DOS... yeah right :-)

Actually it should be called LF2CRLF, because that's all what is does:
converting a newline character (ascii code 10) into a carriage return
character (ascii code 13) followed by a newline character.

Text files on Unix-systems have lines ending with just a newline.
Most text files made under Mint, Linux etc. look like this.

Text files on DOS-systems have lines ending with a carriage return
followed by a newline. Text files made under plain TOS look like this too.

If you try to display a Unix text-file on an ST with
plain TOS you'll get something like this:

line 1
line 2
line 3

instead of

line 1
line 2
line 3

That's why people convert Unix text files into DOS text files.
UNIX2DOS is a really simple program. If I need it but don't have
it, I just write a little C program within 1 minute, which does
the same thing :-)

Hope this helps.

Cheers,
Ronald Baljeu (rjb@xs4all.nl)

No single pd or low-cost viewer does the job entirely, however, the
combination of STUART DENMAN's 'SPEED of LIGHT' and DMJ's DMJGIF should
cover just about every known format with cross-format SAVE options that
allow for effective conversions from JPG, GIF, etc., to the less common
ones like SPC and NEO or TNY

You can find them both at HENSA/micros

MIST AtariFest VII in Indy JULY 13

New date for MIST, the Mid-Indiana AtariFest for an 8th year, is July 13. The town is full of racers and auto buffs, and there's hardly a sleeping room to be had later in the month ... so MIST is July 13.

Same times as in the past: Open at 10 a.m. and close where there's no one left. That's 10 a.m. Indianapolis Time (11 a.m. Eastern Daylight Time) Indianapolis is year-around on Eastern Standard Time, Never on Daylight.

Same place ... two ballrooms at the Best Western Waterfront Plaza Hotel ... and room to spread out the merchandise as well as the crowd. Last year's event attracted nearly 350 ticket-buying Atarians (almost as many as the year before, although it may not have looked that way since we were not so crowded).

Charlie Sears is ready to take table reservations, and he might be enticed to get you a special spot if you call early and pay up early: Call his home at 317.535-4829 or leave him mail on his Crossroad/MIST BBS at 317.535-1643 or 317.780.5473 (FidoNet 1:231/310.0 and AtariNet 51:203/8).

You can reply to me here at shuffman@ideanet.doe.state.in.us (and I do intended to get back on GEnie, assuming it continues to be the Atari Place To Be ... but I have been playing the WWWeb Games a lot lately and had no time for GEnie).

Hotel rooms will be scarce even on July 13, the Best Western people tell us, but they agreed to give us a deal about $5 more than last year: $55 Single or $61 Double ... but you MUST RESERVE the room JUNE 12 -- 30 days in advance of the MIST Fest to get that rate (and probably to get a room at all).
To get that rate, DO NOT call Best Western's 800 number;
you must call the Indianapolis hotel itself and make the reservation with the Conference Staff. If you call at night or on a weekend, leave a message for them to call you back. They do that.
The Indianapolis phone number is 317.299.8400 and the Conference Staff extension is x393.

It's not a bad place to stay, as you know, even if the restaurant leaves something to be desired some years. The indoor pool is nice and there are several franchise restaurants nearby, as is the Indianapolis Motor Speedway and the Indianapolis Raceway Park.

What else? We anticipate an incremental increase in our costs, but nothing dramatic. We will get contracts in the mail real soon now.
E-mail me with any changes in address you suspect might delay mail in the Postal Service. There are too few of us to let anyone get lost or

strayed.

Imagecopy 4 (or 4CD for CD Rom owners). So many file formats can be viewed, converted, tweaked, catalogued, printed and generally played with this program. I use it at least twice a day. Brilliant, fabulous, and still being developed. Oh.... and it's stable, never ever bombed or froze on me yet, despite me chucking some dodgy files at it :-)

It's not exactly giveaway at GBP40.00 (or thereabouts), but worth every kroner :-)

>No fair! Over here in the states, Papyrus 4.0 has only been a rumor!
>Any chance of a review? Anyone know when it's going to be translated
>to English and shipped to the US?
>
>Mike White

I found a minor bug in Papyrus 3.66 recently (English version) and reported it to HiSoft, the UK distributors of the program. They replied, saying that my bug had been replicated, but would file it until Papyrus 4 was released, because the bug may have been fixed ;-). They also stated that the English language version of Papyrus 4 wouldn't be available for at least a month. Which in my reckoning means beginning of March at the earliest.

The preview of Papyrus 4 in AW about eight months ago was very interesting, and the program looks very promising. If the ridiculous hyphenation rules are sorted out (they simply used German rules, though they try to make you believe they're English ones!), plus some form of macros are incorporated, plus a word count (actually promised), it should be a capable WP/semi DTP set-up. Used with NVDI 4, it should give most of us a decent tool to do most word things with.

BTW, I know it says it in the manual, but only in small letters, you HAVE to have SpeedoGDOS installed before installing Papyrus. I spent hours trying to get Papyrus to recognise my new SpeedoGDOS installation. I checked and rechecked my Assign and Extend.sys files, before sussing out what was wrong :-(

Date: 1996-02-09 00:00:00 UTC
From: tderrick@acpu.com
Message-ID: <960209090011271163@acpu.com>
Source record: 150904

jacquesa@cs.man.ac.uk (Anthony Jacques) spake thusly:

AJ> Yet (MagiC) is the best software that was ever made for the
AJ> Atari platform.
AJ> cannot replace the Operating System, because it has to
AJ> co-exist with it (as you say it is illegal to place it on an
AJ> EPROM)

If it is a complete replacement, what is to keep the developer from doing so? If it does use things that are on Atari's ROMs, that does answer the question. Just curious.

If/when I buy MagiC, I very probably would keep it disk-loaded, but others might want the other option, if it existed.

7 > Is Atari fax software compatible with Atari SLM 804 laser
7 > printer? Can a fax be sent directly to the Atari without
7 > resorting to a phone line? That is, from a PC with a fax modem
7 > directly to the ST?

It should be possible. You would need: nullmodem cable, faxmodem at the Atari, and StraightFAX with gdos (with a SLM 804 driver). There may be other programs that would do it.

No warranty is expressed or implied in this post.

Toad or any of the other hardware suppliers should be able to
provide what you need. IIRC, Toad offered hard drive subsystems that
had DMA in and out and SCSI in and out ports, all on the same box.

Try on "http://rand.thn.htu.se". This is the official BM site. But don't be too
nervous, it's not finished yet. But there are very cool people implicated in
the Bm project, like doug Little, THE man who made Apex... Err... I forgot
something : BM will be a freeware Doom clone.

From: al220@torfree.net
Message-ID: <DMJ3AD.CJL.0.sheppard@torfree.net>
Source record: 150913

Hi, I am still trying to get MinixFS going.

After finally initializing a Minix partition I am given an "access denied" message when I try to do file operations on it. And I am using recent verions of gnu-futils.

I suspect that my system doesn't know I am the root user and thus won't allow me access. Does this have to do with my shell prg (currently tcsh) and what file tells the shell that I am the root user? Is this PROFILE or LOGIN file in etc/ folder?

Thanks for your help

Jonathan

I agree, but maybe it would be an idea for Application Systems
Heidelberg to sell ROM chips with Magic in them, so that it could
simply *replace* the usual TOS.

Don't forget to delete the history file, otherwise the program will
assume that you have received the old news.
I noticed that you still use Oasis 1.33E. AFAIR this version don't
look to the hardisk to see if there is enough free space to unbatch
the news. If there isn't you will run into big trouble.
I advice to use the latest version. It isn't bugfree but it's far
better.
Hope this will help.

Message-ID: <4ffvf9$2q8@netty.york.ac.uk>
Source record: 150920
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer,alt.binaries.sounds.midi,alt.binaries.sounds.misc,alt.binaries.sounds.music,alt.binaries.sounds.samples.music,alt.binaries.sounds.utilities,alt.music.midi,alt.music.midiweb,de.alt.binaries.sounds,comp.sys.ibm.pc.soundcard.tech,pronet.sound&musik

Many moons ago, I wanted to do the same thing but couldn't locate any info. What I ended up doing was creating a sample in Avalon that was 100 samples long - 16bit. Then, in the sample info page I filled in all the data I could, loop points, comments, etc, making them all different. Then I did a hex dump of it and worked out what every character meant!! It took ages, but then I still havent received any replies to my original enquiries, and that was about 4 years ago.

I don't have this info any more, but hope the suggestion helps!

John.

PS. It is well known that sheep like to follow the leader. It is a sad
indictment of society when the 'head sheep' is Bill Gates...

2763. Any new Falcon Demos?

Newsgroup: comp.sys.atari.st
Date: 1996-02-09 00:00:00 UTC
From: chriswil@southern.co.nz
Message-ID: <4fess9$kuk@orm.southern.co.nz>
Source record: 150923

Hi There...

I have been asked if I would like to demonstrate my Falcon at a music technology expo. The stuff I would be doing would be aimed at a younger age group. Things such as adding DSP effects to kids voices as they speak through a microphone come to mind. That is fine, but from time to time the organizers think I could run some cracking gfx demos with accompanying audio tracks (through a LARGE PA system and video projector perhaps? :-)). I was wondering if anyone knows of any new Falcon megademos etc... that I could grab for use in this manner. I have Cycedelic Knockout, Lost Blubb, Lazer, Obnoxious and a handful of others but would really need something of the calibre of the above to warrant display in public. There may be 500 people go through the expo daily, so it would be good advertising for Atari...

Can anyone give me names and ftp address for any great demos I may have failed to mention above...

TIA for your replies...

Chris W.

From: chriswil@southern.co.nz
Message-ID: <4ferfc$kuk@orm.southern.co.nz>
Source record: 150925

My dream Atari computer would be supported by Atari!!...

Failing that, just a design around TOS 4 but with the following...

PCI (not VME, VME peripherals are stupidly expensive IMHO) slots for
graphics, networking cards.

72 pin SIMM slots (8 will do for 16 MB SIMMs giving 128 MB total)

Separate CPU unit/keyboard similar to TT (I like the look of the TT)

SCSI-2 Wide/Fast onboard

EIDE onboard

Built in ADC/DAC video (PAL/NTSC/S-VHS) in/out

The CPU would be 68060 or PPC 604/620 (prefer 68060)

The standard Falcon audio setup, but a Philips TriMedia chip for general
purpose DSP functions including the video ADC/DAC handling

A badge saying Micro$oft/Wintel free zone!!!

...

Ciao, Chris W.

It probably converts file line endings from Unix (LF) to DOS/TOS (CR+LF).

Useful if you are running MiNT/Linux - or move files on and off Unix
systems.

I'm only guessing though! ;-)

I think this program simply adds CR to the line endings. (UNIX uses LF
only, DOS/ATARI use CR+LF)

>The problem with STiK is that it is not really a finished program. It
>really constitutes nothing more than a MoDeM-Connect Subroutine that has
>been hooked into CAB as Browser
STiK is a lot more than just a modem connection program. It has to handle
IP packets which might represent many different protocols, and present the
contents to the correct applications as though they were a continuous byte
stream. In addition it has to handle DNS lookup, and open connections to
the correct computers when necessary.

>and CAB, being in ACC mode, should be written so that it will translate
>data bi-directionally with ANY Terminal Program That allows for this
>type of transfer.

Oh, it does. However STiK and MiNTnet are the only ones that exist.

>In other words, CAB should allow for data feed from programs like
>MTerm or FLASH II.

It might be possible to modify STiK so it would get data from a terminal
program like that, but it wouldn't gain you much as STiK would still be
necessary, there'd just be another layer to go wrong.

Unfortunately, I have to agree with Dan. I have never ever had STiK do
anything without HSMODEM and I run my serial port at 19200. Stranger
still is that the MagiC manual states that the HSMODEM routines are
used internally but STiK refuses to budge. Same thing happens under
plain TOS 1.4 as well.

gz predates at least .zip and possibly others. It does come after .Z, but
that's because .Z included a patented algorithm, so the FSF developed gzip
as a free alternative. (And gzip will decompress the old .Z format
correctly. Obviously it can't write .Z files as that would require the
patented algorithm it was written to avoid)

As i understand it; yes if you also have a fax modem attached to the ST.

A better way would be to get a null modem cable, the connect the 2 serial
ports together and Robert's your mums brother. Ignore the PC fax modem/card
altogether.

Alternatively, dump the fax to a disk file and transfer it by floppynet :-)

No flames from here... The problem is (as I understand it) that STick and
CAB were developed as a part of a cooperative effort by Steve Adam in Australia
and a guy in Germany whoce name escapes me. As I understand it they only had
email for communication.

I agree, a good way forward is for STik to now be incorporated into other
products but again (AIUI) STik _has_ to run as an accessory. Problem.

I really think it is a good piece of work. A bit unstable at first but better
(not perfect) now.

IMHO

Depends on what you want to do with it.

IMHO, if you don't have a hard disk ,a mono monitor & 4 mbytes of memory,
you are probably wasting your time.

The syquest ez135 is a removable media device (AFAIR) I don't know how
well (or fast) MiNT would run from this.

If you just want to learn - it's a good start.

: Indeed, I develop Atari GS on a Sun. I have STonX, but I have been
: unable to get a ROM dump. I tried one utility that didn't work (I have
: TOS 1.0), so I wrote my own program, which doesn't work either.

Ouch! I think STonX needs at least TOS 1.4...

: >Ah, if there just were a MiNT/W version of GS... <g>

: Is MiNT/W Mint Windows? I considered such a driver once upon a time, but

Windows? It's a windowing system for Atari MiNT / Linux and there's
a partial support for Sun's direct8 displays too (the display and how
it's accessed is the deciding factor on which configurations W will
work).

: a cursory look at the docs for MiNT Windows made it look impossible. GS
: runs fine under MultiTOS and Magic though.

If you refer to the lack of gadget/widgets, the next release of
W (during this month) will have a start for a toolkit (usage is
quite similar to Xt although a bit easier (and Wlib is _lots_
easier than Xlib)). It will be done by Kay Roemer.

It's a unix shell script which when executed unpacks an archive which is
embedded in it; the archive is already uudecoded if necessary so it
can be included in an email or news posting directly.

If you're on a unix system, look at the manpage for shar(1).

2792. AtariWorks Italics Hostile?

Newsgroup: comp.sys.atari.st
Date: 1996-02-09 00:00:00 UTC
From: fox@vulcan
Message-ID: <4fe30h$h29@filet.nrlssc.navy.mil>
Source record: 150974

I've had a maddening problem with AtariWorks wordprocessor
recently. I have a two page document (letter) and if I
use italics in it, it crashes! I can use bold and underlining
fine, but if I make a couple of words in italics, it will
print fine the FIRST time, then crash the program when I
ask it to print the document a SECOND time. Very repeatable.

The setup is:
mega 4 ST with 16 mhz accelerator board
speedogdos, using only the fonts that came with it
deskjet color printer

Anyone else had similar problems??

Hey, don't forget GemView, a _very_ good picture viewer!
It can load LOTS of formats, e.g. JPG, GIF, TIF, (X)IMG,
IFF, Sun Raster files, Targa, enhanced simplex, etc. etc.

It can also save or automatically convert pictures into
the "resonable" format, i.e. JPG, GIF, IMG and some others.

GemView is Shareware.

Greetings,

Christoph

Hmmm, dunno. I am using PGS2 all the time on my TT and it loads in approx
3 seconds.

Well for TOS 1.62 I used

```
#include <stdio.h>

#define TOS_BASE 0x00E00000
#define TOS_SIZE 0x00040000

main(int argc, char *argvp[])
{
FILE *fp = fopen("tos.img","w");
fwrite(TOS_BASE,TOS_SIZE,1,fp);
fclose(fp);
exit(0);
}
```

Which seems to have done the right thing.

> solutions.

Hmmmm, interesting.

What about handshaking; could you just run the existing signals (suitably buffered by line drivers of course + a circuit that grants r/w to only one ST at a time) from ST to ST.

Perhaps even use drive A & B so that you can do a sort of ring network & link several machines.

It sound very difficult, which might explain why there are cartridge port networks & ethernet adapters for the ST.

I see a possible problem: unless you can make the 'drive network' look like an ordinary disk on bootup, you won't be able to load the driver software because you will have replaced your floppy.

I realise that following up to your own post is weird, but...

In article <lz6m2p7g@qnx.com>, Chris Herborth <chrish@qnx.com> wrote:

[...Ultima IV, Quest of the Avatar...]

> I've just bought a used copy, and I want to run it off my hard drive...
> I loaded all the files onto my disks, redirected A: and B: to point to
> my hard drive partitions, and the damn thing *still* accesses the
> floppy, then crashes.

I've found out through experimentation that Ultima IV, despite it's wankery floppy access, runs fine under MiNT. Using MiNT's path aliasing, I can redefine a: to be k:\ultima4\a, where I've put all the files. If I leave the Ultima IV disk in the pysical A:, it'll access it directly for the copy protection, but run Ultima IV from the hard disk.

The only problem is that when it asks for disk 2 in A:, I'm kinda screwed. I'd put all the files in one directory, but there's _one_ file with a duplicate name, and different sizes. :-(

I'd hoped that Ultima IV might look for two disk drives, and use that, but apparently not. I had B: aliased to k:\ultima4\b and it still wanted me to switch disks. Ah well.

He was right. There is a software one called, PC Ditto which is quite old, and probably only available 2nd hand.

Also there is AT SPEED which is hardware, you might be able to get these from Compo, or System Solutions.

Having said that you really should be realistic. PC Ditto is SLOOOOOW beyond belief, forget running windows, or even most DOS Progs, and most certainly games. I only ever managed to get CoreWars for 8086 to run on it, and that was slow !

I really don't know about AT SPEED, but it is unlikely that as it emulates a 286 you are likely to get windows running, some DOS stuff might go, but not too fast, so games like DOOM won't go !

Think about this quit a bit before you spend 150quid on AT SPEED !

> FDT) 'Luck! :)

My terminal program "Connect" does this before it dials a number.
The problem isn't within the modem, but on the computer itself. I can
switch on/off the modem before I dial and the problem's still there.
I'd like to find a better way than to reset the machine.

Uploaded and have no idea about what it does, heh? ;-)
You must mean 'downloaded'...

Well, 'Unix2dos.ttp' converts the 'end of line (often referred to as EOL)
characters from Unix to DOS/Atari ST standards.
In Unix a line ends with a line-feed (LF) while in MSDOS/Atari it ends
with a Carriage return/Line feed (CR/LF)

So what does this mean? If you try to read a Unix EOL text on your
ST's desktop with the "read" fuction (by double clicking a text file)
the text will appear all random or something. You can press the RETURN
key to advance which will ofcourse manually add a CR for each new
line! Reading a text like this with an editor is okay though.
Or... you can convert it with Unix2dos.

If a text file has Atari/MSDOS EOL characters (CR/LF) however and you
read this on a Unix system you'll see '^M' characters at the end of
each line- which is a far more serious matter since setup programs,
scripts or whatever won't be able to interpret them properly, so if
you've done some work on your ST which should be read on a Unix system
use a program called.... you guessed it: "dos2unix.ttp".
To use the programs, just enter the name of the text file to convert
and it'll change the EOL characters.
Hope this helps.

Like the man said, no one utility will do it all-but for my money
the latest version of ImageCopy (4.0 now) is the best all-around.
Of course, it is commercial, though...

If your Mega ST does -not- have a graphics card installed and you just
want to view the best pics you can then I highly recommend PhotoChrome!
It will convert Gifs (and a few other formats) into the best darn pics
(PCS or Spectrum formats) that have ever graced your ST's monitor...!
I believe that its freeware/shareware too....(it was written by the same
guy that did the (awesome!) Apex Media program for the Falcon! :)

DGW> Does anyone know if it is worth trying to set up mint on a 1040
DGW> stfm. I'll be
DGW> using a syquest ez135 so I have a fair amount of hard drive space.
DGW> Also what
DGW> are peoples thoughts on desktop replacements like thing.

Desktop replacements are excellent.... Thing is the best shareware one...
Ease is the best commercial.
It is possible to set up MiNT or a replacement desktop on a 1 meg machine..
but it is a bit tight. Setting up both at the same time would be daft! ;-)

You should upgrade to 4 megs then get Ease, MagiC and NVDI (in that order).
You don't have to do it all at once... in fact doing it over a period of time
would be better because you learn the fine details of each program a lot
better.

This garbled offering from rwhit@edenbbs.com to All was spewed forth...

Hello rwhit@edenbbs.com...

.are you /the/ R White??? <vbg>

r> What is MagiC that everyone is talking about. It sounds cool.
r> will it work on a 2.5 meg st?

It is a multitasking system for the ST..... like MiNT but much, much better.
It allows you to run several GEM programs at the same and flick between them
via a menu that is installed in the menu bar.

You can also multitask TOS programs by using a VT52 emulator. This means
that all the TOS output gets put in a GEM window.

Multitasking is amazing.... it means that you can have a text editor,
graphics program, desktop etc all running at the same time.. with no
noticable speed decrease. :)

The only "small" drawback with MagiC is that it totally replaces the ST's
ROM. This means that is wipes the GEM desktop.... and you have to use a
replacement desktop like Ease, Neodesk, Thing MagiCdesk (supplied with MagiC)
etc etc... all are 1000 times better than the standard GEM desktop anyway, so
you won't miss anything. It is also a lot faster than TOS and speeds up most
programs.

MagiC 4 (UK/USA) release will be available very soon.. and I strongly
recommend that you get it! :)

This garbled offering from hbact182@csun.edu to All was spewed forth...

Hello hbact182@csun.edu...

h> serves my purpose well. What are some of the good word processors
h> that are still available. Do they compare to Microsoft Word for the

The most powerful is Protext... but it is very hard to get used to, and
doesn't support screen fonts which is a pretty big drawback.

Your other options are:

Papyrus Gold
That's Write 3
Redacteur 3

IMHO That's Write is the best.. but other people think Papyrus is for varying
reasons.

IIRC, Redacteur isn't as popular.... and only very nerdy people use Protext
nowadays ;-)

Older versions of Papyrus and That's Write (AKA Write On for the older
versions) are also excellent and considerably cheaper.

h> PC? I will also need some info about fonts and printers which are
h> compatible with the ST. I currently use a dot matrix printer but I

Practically any printer made within the last 4 years is compatable with the
ST. If you get a Cannon, Hewlett Packard or Star you can be almost certain
that it is ST compatable. All you really need to look for is that it is
Epson compatable.

h> If I do decide to keep the machine, I will also probably want to
h> upgrade the monitor. My SM 124 just won't cut it anymore. Especially

The SM124 is the the best high resolution monitor for the ST. If you get a
colour monitor (the Atari SC1453 is the best) you loose the high
resolution.... so unless you are interested in games or colour art you are
best sticking with the SM124.

h> I guess the bottom line of this post is to find out if it is still
h> worth keeping my Atari or jumping ship and getting a PC. Money is a

ARgh!!! Don't do that.... it will be the biggest mistake you ever make! I
know so many Atari users who have changed to a PC and severly regretted it
afterwards. Unless you are interested in high quality graphics or very high
quality sound your ST can do almost anything that a PC can... and much
easier!!

How does one get a dump of all the news groups available?
This is using NOS / Oasis

I have new groups on in the startup.nos file
every now and then when doing NNTP I get 1 new group message
I would like a dump of all the groups as I dont think my NG file contains all of them at present.

Thanks,
Bob

The program's documentation says that you can split MagiC into several
numbers of files. For example, if your system has two chips to store the OS,
the program, which I just can't remind the name, will be able to split MagiC
into 2 files, and so on... Great, isn't it :)

>thesaurus in a desk accessory which is shareware or freeware, and I have
>Thunder! spellchecker (an oldie and the gui is crap but she files!).

>Drop me a line if you need help...

Hi Dave
The original posting was by me, Phil responded and indeed managed
to supply me with a dictionary, but I am still desperatly searching
for a thesaurus, If you can help then please please do :)

Many thanks :)

BTW Just to clear up any missunderstandings, from my original
posting asking for the above, for First Word 3.20, some people
responded by simply telling me that if it was an original then I
would have the dictionary, no help or offer of a dictionary, but just
felt they had to tell me I should already have it,
My disk of First word is NOT a copy, or a pirate or whatever they
are called, however TBH I was under the opinion that this software
was in fact PD, this seems not to be the case, so maybe I should have
explained originaly , why I was minus the Dictionary,?, hmmm I was
suprised that some people automaticaly presumed I had a naughty copy
and did not think that there could be a perfectly reasonable
explanation,
My apologies for boring you, but I did want to make the above quite
clear:)

Cheers......!ynoT

I guess System Solutions/Atari Workshop are about the best Atari shop in London. I haven't been there yet, but in recent correspondence with Graeme Rutt, who works for them, he tells me that they have beefed up their staff so that they can spend more time with customers and demonstrate equipment.

I'll be going there soon to see a Falcon CDR system, but they'll probably be happy to show you more or less anything.

NEVER use a switching power supply without a load connected to it. If it
wouldn't have been broken before, it would now be.

If the fuse goes lightning, then very probably the AC->DC converter is blown.
(Round four-pin thing on the left side of the PSU, labeled + ~ - ~. Ask local
electronic shop for a suitable replacement.)

In article <824018948_OASIS_@wuss.demon.co.uk>,
Steph@wuss.demon.co.uk (Steph Taylor) writes:

>Is MiNT a complete operating system replacement?

It's a complete TOS replacement. It doesn't replace GEM although if you want to multitask GEM programs you'll need to, either with MultiTOS, or when they're released with N.AES, XaAES or OAESIS

>Do I have to run in a command line interface, or can I float Ease over MiNT
>& forget all about it?

Yes you can. There is no need to install a command line interface.

>If I want to run a program that doesn't like MiNT, is there a way of turning
>it off? Or do I need to reboot?

Very few programs do object to MiNT, but yes you would have to reboot.

>Does MiNT slow the system down any?

Not significantly. A few things are a bit faster, a few are a bit slower. Overall there may be a slight slowdown but not significantly.

>Does it eat up huge amounts of disc space?

Not just MiNT, it depends how much extra stuff you want to install.

>What are the advantages of installing it?

Well, you get MiNTnet, which is a proper IP layer and has most unix networking software ported to it. You won't get much benefit from the multitasking unless you install another AES. You can get long filenames but that requires you to reformat your hard disc (or any partitions that you want long filenames on anyway)_

>What do I need to install a basic MiNT setup? I've downloaded KGMD (or at
>least some of it), and it is in German (surprise!). I've got no idea how to

>maybe as is yes , but for example there are cheap PCs on the market with video
>serial and/or IDE built onto motherboard for example ,

More likely in more expensive branded PCs. The really cheap ones won't have that
as it means making your own motherboard. But FWIW my PC like many others has
serial and IDE, not to mention audio, on the motherboard and worked fine with
linux (far easier than getting it to work with DOS infact)

IDE is never a problem, serial is only if you have a large number of ports.

>> >Diamond Stealth <G>
>> Actually I would now...
>
>How many more situations like this maybe out of date example exist though ??

I'm not aware of any although there may be some. The most common video cards
in cheap PCs are Diamond and Cirrus, both of which are (now) supported by
linux. You're likely to get better video card support for linux than for
Windows.

I'm lucky enough to live half a mile away from Systems Solutions in East
Dulwich, London, and every time I've nipped down there they've been most
helpful, despite the fact that probably 75% of the time I don't spend any
money! (Hopefully the other 25% makes up for this). Mind you, if you're
using a bog-standard ST, Karl Brandt _will_ try to sell you on the
benefits of a PAK accelerator, Desktopper, graphics card.......

But seriously, get down there and say hello! And pop in for a cup of tea
up the road when you've finished, 'specially ifyou've just bought a great
piece of kit you want to show off!!

Andrew

Does anyone know of a program that will get rid of the extra LF/Line added on what seems to be most UNIX text. Eg this piece of text you are reading now will appear below, with extra lines, which will be shown in a sec. The reason I ask is because some of the files are a little too long to do it by habd, or even with macros. I also tried search and replace, but its an LF not a Character, any ideas ???

BTW: this is what the text looks like:

Does anyone know of a program that will get rid of the extra LF/Line

: 1. Which program(s) do you use to connect to the net with CAB?
:
: a. STiK
: b. MintNet
STIK
: 2. What TOS/OS do you use?

: a. Normal Tos (Please add version)
1.06 (STE)
: b. Multi Tos (Please add version + AES version)

: c. Mint (Please add version)

: d. Magic (pav)

: e. Geneva (pav)

: f. Other (please identify)

: 3. How often does CAB crash on you?

: a. you mean it actually runs ;)

: b. often
Often
: c. rarely

: d. once or twice

: e. never

: 4. If using MiNT or MultiTOS, which CAB.OVL do you use?

: a. Dancer's MiNT Net

: b. Newsome's STiK

: Thank you for your time,

: Dan Ackerman

2835. Papyrus 4/5

Newsgroup: comp.sys.atari.st
Date: 1996-02-10 00:00:00 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <4fiaic$8mt@dux.dundee.ac.uk>
Source record: 150860

I quite like Papyrus 3.54 or whatever it is I have got However there are
one or two annpoying things that are missing:

decent drawing tools
word count
FULL colour graphic support.

Are these implemented in 4 or 5?

Rod

Does anyone have dynacad for the ST for sale?
Let me know how much you want.
Thanks
Tom

2837. FOR SALE: Mega ST II

Newsgroup: comp.sys.atari.st
Date: 1996-02-10 00:00:00 UTC
From: Timothy Miller <millert@csee.usf.edu>
Message-ID: <Pine.SUN.3.91.960210104250.22806A-100000@grad>
Source record: 150862

I'm selling the following items:

Mega 2 ST $150
45 meg seagate $20
42 meg quantum (stuck) $5
SCSI controler+cable $20
Case and pwr supply $30
Laser C $30

The quantum drive is stuck. Lubrication on the spindle has spread out on the platter, so when the drive parks, the head gets stuck in it. The only way to free it up is to twist the drive around the axis of the spindle, by hand. But it's often not long before it get stuck again. If you want it, $5 isn't much for something to play with.

The case and pwr supply are kinda heavy, but the pwr supply will power anything.

The Mega 2 works great, but some of the keypad keys have stopped functioning. Perhaps you can clean it. The mouse also needs to be cleaned.

If you don't like my prices, make an offer.

2844. Help SM124

Newsgroup: comp.sys.atari.st
Date: 1996-02-10 00:00:00 UTC
From: john.blackwell@aspects.com
Message-ID: <9602101530272368@aspects.com>
Source record: 150869

I'm having what looks like the 1st signs of trouble with my beloved
Atari mono monitor.

The width of the picture starts bobbing in and out on the right side
of the screen, (randomly) and at the same time the horizontal
linearity changes slightly. Occasionally there's a bright streak
occurs on the picture.

I seem to remember reading that there's an infamous fault happens on
these monitors, like perhaps a capacitor going open circuit. Can
anyone fill me in as to which one, and whether my symptoms seem to
fit the problem.

I've had a wee poke around, and noticed there seems to be a lump of
goo hanging around the bottom of three small electrolytics between the
line output transformer and focus control. It's not easy to see
whether the goo has leaked out of one of the capacitors, or whether
it's there on purpose to stop a linearity coil from shifting around.
(This coil seems very sensitive to me probings).

Help!

On a less important note, whenever I use a screen saver with it (I'm
rather fond of IDLE 2.2) within a few seconds of it clicking in the
screen fades darker, making my nice star field and bouncing atari
logo completely invisible. :(
I've never seen another SM124 in operation, so I don't know if this
is normal (it *seems* like some sort of AGC, except for it works
backwards!) but none of the SM125s I've seen do this.

However, this pales into insignificance compared to the other
problem.

Hope someone can answer this one please!

John

>
>I can't get NOS to work with MagiC 2 for the same reason.. :(

Nos needs about 500K just to load - who knows how much it needs when
it starts doing something. I still use Oasis 133E - you can/have to
run it separately from Oasis.

I can't remember exactly what I did to Nos to get it working but
here's some starters (assuming you have the memory):

I may have used LIMITMEM.TTP on it.

Rename it to .PRG and start it single tasking with a command line of

-d G:\OASIS -s 40 STARTUP.NOS
^^^^^^^^
The SPOOL directory is in this path.

and after it terminates run oasis which if it is the same as 133e
should be able to locate your emails. If it can't you've got it set up
wrong. Use the "unbatch" to get your news.

2847. list of Atari ftp servers

Newsgroup: comp.sys.atari.st
Date: 1996-02-10 00:00:00 UTC
From: gufl0000@stud.uni-sb.de
Message-ID: <4fihea$2pf@hades.rz.uni-sb.de>
Source record: 150872

Hi everybody!

Actually for my own convenience I've created a URL with a list of Atari ftp servers. The adress is

http://stud.uni-sb.de/~gufl0000/atari

The URL is in English! When you follow a link you land in the right subdirectory for Atari.

Maybe there is a list like this already existing. If so would you please contact me.

Some remarks: The URL is currently very poor (only six entries). I'd be glad to receive some feed-back, especially the adresses of other servers not yet included. (There's a mail button on the URL, so please look first).

There are only two (but good) pictures on the URL. First reason is speed, second that my web-browser knows neither pics nor sounds. So don't complain about the URL being quite boring. It's for information only.

Waiting for criticism and approval!

Guido :-)

2849. SyQuest EZ135

Newsgroup: comp.sys.atari.st
Date: 1996-02-10 00:00:00 UTC
From: rich@rjelwell.demon.co.uk
Message-ID: <824048294_OASIS_@rjelwell.demon.co.uk>
Source record: 150874

Just to chuck in my 2 pence worth.
I have recently purchased a SyQuest EZ135 and am very pleased with it. Pretty much just a plug'n'play device. I did have a little problem with my Falcon insisting that there were four partitions on the drive, despite being repartitioned to just one. This was fixed by altering HDDriver's config to have only one default partition.

One thing that must be mad clear is that once formatted the cartridges have about 128Mb free. This is roughly equal to 135 million bytes, which is not 135Mb. Hard drive sizes tend to given in terms of the actual number of bytes not in Mb.

Using a simple test program that, I think, came from an old cover disk the EZ135 proved to be quicker by as much as 35% than the internal IDE in my Falcon. Only during many multiple small read and writes was it slower and only then by about 20%.

When formatting the cartridge with HDX it partitions it with large sectors. I would advise using the HDDriver partitioner with the minimum sector size option selected, it gives a slight performance increase.

2850. Re: OASIS unbatch bombs

Newsgroup: comp.sys.atari.st
Date: 1996-02-10 00:00:00 UTC
From: 100710.1360@compuserve.com
Message-ID: <824059188_OASIS_@compuserve.com>
Source record: 150875

In article <823453470_OASIS_@swampdog.demon.co.uk>
guy@swampdog.demon.co.uk (Guy Harrison) said:-

[about Oasis bombs while unbatching]
>This seems to happen in two ways - the obvious one is the fault is in
>batch.txt. The other is that the news you have currently got is buggy.

Comments about the first one: It happens when you have several lines
"#! rnews 0000000000" in your batch.txt. NOS adds this line at the end of
the file at each end of a nntp session. It's normal, it's the end marker.
But if you made more than one nntp session before unbatching, you have
more than one of this lines anywhere in the file.

This happens if you have made more than one "nntp kick" or autokicks
via the poll delay (the "nntp addserver newsserver delay" command in the
startup.nos), if you have polled more than one server (I have a setup with
3 newsservers), or if you selected "local post" in the Oasis Daily Net
config.

Unbatching such a file not only bombs, but also corrupts in some way
the message base... or at least loose a single message.

Cure: first deselect the local post button in Oasis, put a very great
delay in the addserver command (I use 60000, never been online more than
16.6666 hours at a time!), then test (and remove) with a text editor the
rnews-with-ten-zeros lines.... (not the last one!)

But there could be a problem: I use XXEDIT the hex/ascii file editor
for this, because text editors could corrupt some articles... cutting out
some characters from too long lines, or deleting trailing spaces, etc...
Most editors cant handle lines more than 256 chars long. Everest go up to
300 chars. I've seen lines of more than 500 chars long in articles...

And it's not good, you cannot add/remove a single char from the
articles in the batch.txt, unless you modify the rnews value... which is
actually the length of the article, but counting CR+LF for one.

Message-ID: <4fjb8p$c64@news.coastnet.com>
Source record: 150880

I agree with this tack.

I used to program ataris with MEGAMAX C. the code was great(compact) but I still could make refinements after disassembly to make it even better.

Now I'm working on a PC under windows 95 and I can't believe the kind of waste in this system. Wasted memory, sloppy coding, excessive repetition of routines.......the list goes on.

I wonder how big the hard drives are going to have to be when these people reach the peak of programming laziness.And also how slow the programs are going to be. Or maybe we'll make yet another microprocessor to go faster so we can waste even more space.

I also can't understand how a company like microsoft can get away with making an operating system that takes as much as 2.5 minutes to oad into my computer???????????

PETE

2856. A few 520ST questions

Newsgroup: comp.sys.atari.st
Date: 1996-02-10 00:00:00 UTC
From: tuf@cyberspy.com
Message-ID: <4fjd0t$n2l@news.cyberspy.com>
Source record: 150881

Ive come to the conclusion that Cubase on the ST is more stable and easier to use than the PC version(s), and since I have the ST just sitting here, I might as well try to sync my PC and ST up and see if theyll be friends. A few questions though since Im a little out of it.

1) Ive got an external EZ-Drive sitting around here. On the ST Ive got the orignal ICD STHA+ (I believe) controller...the one with the clock on it. I dont think it has an external DB-25 on it, but Id like to get the EZ hooked up and junk the HUGE case Ive got that holds an ST-4096 and 251 with some sorta Omti RLL to SCSI deal on it. Whats the best way to do this...I thinking the Link 2 would be nice, and it should come with newer drivers to run the Syquest, correct?

2) Link2 has no clock, correct? Its nice to have one, and I cant use a cart port one cause of the Cubase dongle (Thanks Stienberg). Any other alternatives? Maybe I could somehow rig up a DB25 to my STHA+ and put it in a little desktop case or something.

3) Years ago I had Wes Newell put a TAB board in my old original 520, but we left TOS 1.0 working (TAB partially installed) since I didnt have 2.06 chips. I ordered myself some chips way back when, but they are 2.05. Im wondering if anyone one knows whether these will work or not in the TAB and if not if anyone needs em!

4) Anyone know of a way to get a MIDI thru going on the ST, preferably one that works when the machine is turned off?

5) If I decide to scrap the old 520, do the 1040 STes have built in clocks? I know they have everything else Id need like the HD port for the link, the SIMM sockets, TOS 2.06 abilities, built in flop, etc.

THANKS to anyone who helps me out here!

Joe

>removing it, but for some reason, I am having trouble booting from the
>external SCSI. Is there a DIP switch or NVRAM setting to permanently
>disable the IDE? Is there a specific piece of software that will do this?

I use a freeware program called FastBoot which bypasses memorytest and the
internal IDE boot sequence. I use this as I don't have an IDE drive (it
takes the Falcon about 10 seconds to discover this on boot-up) but I
think it should solve your problem.
Fastboot installs a bootsector onto a floppy disk which you keep in the
drive when booting.
Bye,Smout.

>edit the fonts (Since they are PD) so that they will work with Calamus SL.
>

Are they really PD? There were a couple of non PD fonts floating around Shareware disks. I do know how to remove or change the serial code on a font, the actual serial number is quite easy as it near the beginning of the data file, However there is a table that points to the offsets of the character drawing data that is encrypted using the serial number and another number in the font file so that if you remove the serial number you also lose the key to decrypt the table. Certainly if you just remove the serial number the font is unusable.

An editor like GENUS simply ignores the table of serial number fonts and places the character data as it comes in the font character set, so some of the characters get jumbled up. (Serial number fonts usually have the character data not in order).

I used to do this with FONTY but as, now I understand the encryption method I allow encrypted fonts to be edited but they are re-encrypted with the same number when saved.

I have a special version that I have not released that can decrypt and remove the serial number and encrypt and assign a serial number to any Calamus font. But as FONTY is meant to be a proper utility and not a piracy tool I chose not to implement it in the released version.

Yes, some shells don't support command lines longer than abt. 127 chars.
You are looking for tcsh or bash. tcsh has been ported by Michael Hohmuth
at uni-dresden.de.

Source record: 150889

Some while ago, I had asked about trying to download anything off of STalker without getting any timeouts. Lots of people had responded with different solutions includung Dan Wilga himself :)

But someone in my Atari user group who also happens to now run the area BBS has answered my problems. This is for those who use a 2400 modem and a 1 Meg system with only a floppy drive.

First of all, the 2400 modem is trying to save on a slow disk which is causing the timeouts. A Ramdisk will quickly fix it, but you would need at least 2 Mb for some of the larger downloads. If you format a disk at 80-9 with the fast format option, it will give your floppy a twisted format which can be read and written faster. I use Format 3 which will let you do this, but there other format programs.

Now with Stalker...set your file transfer buffer(under Prefernce Settings) to about 127K. You can experement, but this works for me. Also I have the AUXINT program running which gives me a 4K buffer.

I have done lots of DL's and I had not a single timeout. I can't wait to try it out on a file that takes up half the disk :)

If anyone has comments or questions please e-mail me as I won't be back on the newsgroup for a very long time. To all the people who responded to my questions, again thanx!

Message-ID: <824070646_OASIS_@phil4.demon.co.uk>
Source record: 150890

If we are going to winge on this group, then can people stop keeping defending things that others call crap. In most cases its a personal preference, if something runs on one computer and not another, the software is indeed crap as far as the user is concerned, my list is as follows:

i) UMICH and IC FTP sites, ones soooo busy you have to use it in the middle of the night, and the other is out of date

ii)An FPU in a MegaSTE, sod all software is compiled for a 68000+68881/2, waste of time !

iii) All ST games that refuse to work on my machine (of which there are quite a lot).

iv) TOS 2.05, why does it have sooo many bugs, why couldn't they have waited until TOs 2.06 was released, and why didn't they offer free upgrades ?? (I have to pay 50quid !).

v) Any demon service when it doesn't work, and I want to use it !

vi) All those REALLY SLOW WWW sites !

Thats my lot !!

From the preview in issue 1 of Atari World, Papyrus 4 should have a word count, some form of simple macros, and possibly support for colour. Plus automatic pair kerning and full support for all the characters in a Speedo font.

I had a letter from HiSoft last week in response to a bug I had found in Papyrus 3.66, saying that version 4 won't be available until March.

Don't hold your breath.

2870. STik solutions

Newsgroup: comp.sys.atari.st
Date: 1996-02-10 00:00:00 UTC
From: rwhit@edenbbs.com
Message-ID: <824049920_OASIS_@edenbbs.com>
Source record: 150895

OK,
after messing with STiK for a couple of weeks now I have figured out
what causes certain problems.

1) Message "error reading file /www/cache/00000001."
Reason: A)
This has to do with your cache settings. If you have 8 meg available
on your hard disk and have the cache setting "keep free" set fo 8 meg you get
this error. I set me keep free setting to 1 meg and this resolved the problem.

Reason B)
You cant run from neodesk. Why I dont know but it wont work. I am running
neodesk version 3x and I get the error reading file message every time when I
run cab from neodesk. I have not messed with it yet but I think it has
something to do with environment settings (i.e. path setting). If I run from
the gem desktop all is fine. If someone figures this out please let me
know.

2) Data lights on modem blink but nothing comes into cab. I have found this to
be the MTU, MSS and window sizes in the stik cfg file. My ISP wanted me to have
MTU set to 1500. I think this is comon now a days. In the TCP/IP docs I have
read, MSS neads to be a multple of window (i.e. mss=1460 window=11680, would be
a multiple of 8 however, they recommend a multiple of 4) Those are my settings
and things are a lot more stable. I use to have hangups a lot and now I dont.

3) Cant get dialer to work. I have found (for me) that my ISP logon messages
are ANSI. What I did was to load a simple term program and see exactly what the
data stream (or characters) the ISP was sending me. I put those in my dailer
script. (i.e. logon is LOGON:@D>) This finally got my dialer working.

Hope this helps someone out there who has been having problems.

>Unfortunately, I can't get CAB/STiK to work at all... This seems to
>have something to do with my hard/software: accelerated Falcon (36 MHz),
>Fast-RAM, Geneva multitasking OS, etc...

I don't know something about Geneva. But with MagiC you must switch off the
pri¿½emptive Multitasking!

When the pri¿½emptive Multitasking is on, then after a few Minutes the RxD
and SxD LED's in the modem are allways on. And there's no way to recieve
any data.

When you switch the Multitasking of, CAB works beautiful and it crashes
only with some pictures. (try it without pictures and it works with no
problems!)

>my hard drive at home.

Guess what Dan It was scrapped a while back I was a beta tester for it
then the author had to join the Army etc so he didn't have much time
to continue it and then Cab was made compatable with stik so he stoped
afaik it was going to use stik for its net connections as well.. pitty
it wasn't continued the version floating about is the last but one
beta I think.

Nick.

LDW claims that its files are Lotus 1-2-3 compatible so it's probably best
to use this route.

Does AW have a "Lotus Import"? Or can you get access to a PC Lotus (or
clone) which could do the initial data conversion for you?

l> Has anyone experienced any similar problems. Would it be just a case
l> of pushing the chip in more firmly or would soldering be required.

I'm not familiar with the Go Direct expansions but have used the AS&T
(soldered), Marpet (no-solder) and have done my own 256Kbit -> 1Mbit chip
substitutions. The problem is almost certainly a bad connection somewhere
but how easy it is to track down it will depend on the complexity of the
electronics. On my DIY expansion I had well over 500 soldered joints to
check!

The most likely failure points are pressure connections (plugs into
sockets, SIMMs into chip carriers etc.) Next look at any flying wire
connections to the ST PCB (particularly ant power lines). Only after this
should you worry about connections on the RAM expansion PCB itself.

Did you get any test s/w with the expansion? This can often help trace
which bank the failure is in.

y> Author: Yngve Sandal Address: yngves@ifi.uio.no
y>
y> I am looking for a pictureviewer/graphic utility for my mega st2. Does
y> anyone
y> hav any suggestions ?

Try GEMVIEW - it runs in all resolutions, is shareware and is modular so you can upgrade it as required. :)

I'm not sure, but give HENSA a bash, it's probably in there.

It does but currently the kernel on the CD is a bit out of date (but useable)
it makes a good starter kit if you don't fancy downloading megabytes of packages
and then try and install them .. best part is the HUGE supply of doc's faq's and
info files on the CD.

> Not knowing much about system setups, this could be the answer I've
> been looking for. Up-grade my system, retain compatibiliy with old
> Atari software (via TOS) and then re-boot for a UNIX workstation.

yep .. IF you have an 030 CPU and FPU .. i.e Falcon,TT,Medusa or similar
If you have an ST then you can get MinTNET /MiNTOS which is a good working
system aswell ..

> Any comments would be useful, as would any about other OS's currently
> available for Atari hardware.

NetBSD is also ported to Atari (same system requirements as linux).

> BTW. scsi is hardly used in pc's nowadays.

scsi hardly ever used in pcs in the past either ... netware servers and other such useage apart ... IMHO most certainly despite some very nice scsi hardware for the PC ,too many pitfalls for a "user" level machine.

> :if you want to do anything more than running the pre-installed applications.
> first thing I did was reformat the HD and install linux. no problems.
> except for using scsi of course. this is always a problem under linux.

yes but lets be honest you know what you are doing <G> .. there must be a fairly hefty majority of people who do not even know what make of video card they have in there computer and really do not care too either , fine but lets agree here that tell them to go try linux would be a best "bad advice"

> :better be prepared for a fair to large amount of problems with configuring and
> :having to call support numbers and check before hand if your various cards support
> nope.

you aleady said that scsi is a nono for linux though :-)) Again of course I agree you know what you are doing ... a quick scan of the comp.os.linux.* newsgroups and immediately a pattern emerges , loads of people not able to get linux to work with XXXX hardware ...

> :recommend a very popular pre-installed video card manufacturerer ..
> :Diamond Stealth <G>
> this remark is completely offtopic as I never mentioned diamond. Of course
> you have to be careful when buying a PC, but I never said I was not
> careful. just saying that you can buy a VERY good pc for VERY little money
> (as opposed to the extremely expensive falcon).

you get what you pay for <G> but of my system the only part that is not identical to what I would have in my PC setup is the Falcon motherboard and this gives me (has given me for a few years now)..a reasonably trouble free home system , at work however I am quite happy for eveyone to be using PC hardware since I am paid for all that <G> ..

> sure, diamond had problems with linux (not anymore though).
> this is off-topic though.

Arguably this whole subject is off topic but it was a fine example of why PC is not the answer for many people who look for cheap and easy life , you need to know what you are doing very much more .. yes you can get a very much more powerful system but also a very much more problematic one aswell ...

???? I never suggested such a thing at all !

> He really has to wake up. Buy a complete setup from a good manufacturer
> (I bought mine from IBM) and there are NO problems. You will have mainstream

yes but then you are no longer talking about a cheap system at all , I have
IBM (aptiva) users ... they paid a LOT of money for them , even from discount
stores an aptiva is up to 2* the p[rice of "comparibly" specced clone badged
equipment ... arguably destroying the "price" argument v's Falcon.

> hardware (CL,SB, Intel etc) that is supported by ALL os's I tried
> (dos, win3.1, win95, linux, OS/2.1, Warp).

I agree with this of course , but we were talking about buying cheap branded
ready to use hardware not IBM badged (incidently MS have been known to even
tell Aptiva users that there hardware is unsupprted !!) or build you own box
with the knowledge of what you want to do and how to do it and what is needed.

Peter Keller (p_keller@conan.ids.net) wrote:
: Exactly. If somebody could enlighten me on this one, I'd appreciate it.
: The more detail, the better.

I don't know all the gory details, but basically a shell archive (shar)
is where several _text_ files are crammed into a large text file, and
one runs it thru sh to extract. They don't seem to be too popular anymore,
what with zip and gzip and all the rest. Seems that mainly source code
was distributed in a shar file; say you have a file called foo.shar, you
would just type: sh foo.shar, and it would extract the files.

Looks like most (or all?) of them used sed to edit the files...

'D' for delete? There is no keyboard shortcut for delete if you
haven't customized it for yourself (I'm using the UK version of TOS
2.06). I always keep deletes off to speed up things. I used to have
the recoverable trashcan on my system, but it slowed things down too
much. I recently found out that "Chkdisk 3" has an undelete function
that works, and where you don't have to be a hacker using a
disk-editor in order to regain lost files.

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. E-Mail me or call me at
216-729-0761 evenings EST.
I am also open to trade offers. E-mail me your list.

HARDWARE

Atari SM124 Mono Monitor $50.00

MISC

GE Soft Mighty Mic TT/32 4-32 Meg TT RAM Board.
0 RAM Installed Best Offer
TT RAM board that can hold 4-32 Meg of RAM. Board works but
when the machine gets hot the system bombs. With board removed
or system cold, system does not bomb. May be a MMU chip?

GAMES

Carrier Command by Rainbird. Complete with box, docs, and disks $10.00

Conquest of Camelot by Sierra. Complete with box, docs, and disks $10.00

Dragonflight by Thalion. Complete with box, docs, and disks $10.00

Gold Rush by Sierra. Complete with box, docs, and disks $10.00

Omega by Origin. Complete with box, docs, and disks $10.00

Wayne Gretzky Hockey by Bechesda Software. Complete with
box, docs, and disks $10.00

2886. Edit Plus (formerly known as EdHak)

Newsgroup: comp.sys.atari.st
Date: 1996-02-10 00:00:00 UTC
From: Craig Harvey <harvey@mail.ic.net>
Message-ID: <4fh349$3v9@condor.ic.net>
Source record: 150939

Here is some updated info from the author of Edit Plus (formerly EdHak, formerly Diary)

Clear Thinking
14 Payeur Rd
Ann Arbor MI 48108-9749 USA

harvey@ic.net
http://ic.net/~harvey/editplus.htm/
GEnie support area: CAT 2, Topic 40
313 971 6035 (bbs)
313 971 8576 (voice)

Edit Plus is available from Toad (I think for $29) or directly from Clear Thinking.

Upgrades

1.If you just bought Edit Plus 3.13 in December 1995 or later, you can upgrade for free to version 3.2. If you can not receive the upgrade by email, there will be a $3 US cost to cover
shipping/disk/etc.

2.Otherwise, upgrades to version 3.2 sent as attachments to internet email are only $5 US. This also applies to any GEnie users who order the upgrade by the end of February 1996.

3.If you don't fit into either (1) or (2) above, then the upgrade cost is $10 US including shipping in North America. Outside North America, add $2.00 US.

Money?? VISA, MC, money order in US dollars are accepted. Upgrades are only available from Clear Thinking.

Manuals

The gorgeous, incredibly useful, information-packed Edit Plus 3.1 manuals are still available.
Along with the brief README file that comes with the upgrade, the manual covers everything in
Edit Plus 3.2. If you don't have one of these manuals yet, get it now for just $8.00 US on top
of any applicable upgrade cost in options (1) to (3) above.

Hear Hear!!!!! :)

If I ever do manage to afford to change off of this 1040STf of
mine, It will either be a TT or a Falcon!

I do fully support the Atari Hardware and Software that I have
seen and used. (and yes, I have a lot of friends who use IBM's and/or
Macintoshes....The one's with the IBM's seem totally lost, and the Mac's
seem fine, but, too expensive for me).

I am glad to come across SOMEONE who actually enjoys there
computer.

Thank You! :)

: Hi,
: is it possible to replace the internal hard drive in the MEGAFILE 30 with a
: larger & less noisy drive?? Any modifications in the electronics needed?

: Any suggestions would be highly appreciated, maybe you could name some
: drives!

Any MFM or RLL drive will do the job. in my case, I bought a Maxtor XT2190 hard drive, but because it's a full-height drive i had to toss the case and put the whole works in a new case. i also had to replace the power supply with a power powerful one as the 50W unit wasn't enough to power this mammoth drive. If you fin that you have to replace the PS, you can get 150W PC power supplies and desktop cases dirt cheap. all you have to do is cut one of the 4-wire leads frrom the PC power supply, cut the leads from the daughterboard of the Megafile from the power supply (there's not much cabling there, so cut the leads as close to the power supply's board as possible) then splice them on to the cut leads of the PC power supply. (Note: There are 6 wires on the megafile's PS but only 4 on the PC's, but you can get around that by splicing the three blue (or weerr they black?) grounds from the Megafile's PS to the one ground on the PC PS)

Of course if you can find a larger (meg) half-height RLL/MFM drive you won't have to do any of this.

2891. MiNT: Friend or Foe?

Newsgroup: comp.sys.atari.st
Date: 1996-02-10 00:00:00 UTC
From: Steph@wuss.demon.co.uk
Message-ID: <824018948_OASIS_@wuss.demon.co.uk>
Source record: 150944

I've read lots of stuff about MiNT, and I'm pretty confused. So I was wondering if anyone could help me out with some questions?

Is MiNT a complete operating system replacement?

Do I have to run in a command line interface, or can I float Ease over MiNT & forget all about it?

If I want to run a program that doesn't like MiNT, is there a way of turning it off? Or do I need to reboot?

Does MiNT slow the system down any?

Does it eat up huge amounts of disc space?

What are the advantages of installing it?

What do I need to install a basic MiNT setup? I've downloaded KGMD (or at least some of it), and it is in German (surprise!). I've got no idea how to proceed.

Well, I suppose that's enough for starters. No doubt the answers will confuse me enough that I have to ask a fresh batch of questions.

Source record: 150945

Well...it's a bit tricky actually.

Basically, you use the data base side of Atari Works...set up however many rows of cells you'd like as columns...and leave some empty rows for the white space, or gutters. Turn off the grid...type down one column of cells (taking care not to type in a longer line than the cell is), and then do the same in the next column.

Once you are finished...save your "Data Base" as a gem graphics file... Then you can paste it into the Wordprocessor for printing.

It's kind of a pain...but as far as I know..this is the only way to get AtariWorks to print in columns without running the page through the printer more than once.

Really, running the page twice through the printer is the quickest way...but if the mechanics in your printer aren't super consistant, the columns aren't going to line up perfectly every time.

I think there is an example, and well written directions for using AtariWorks' DataBase to print up columns. Try ftp atari.archive.umich.edu or wuarchive.wustl.edu (this site mirrors umich.edu...althoe I don't remember the exact path.

Hope this helps,
Brian

2893. IDE-harddisk on the ST (A summary!!)

Newsgroup: comp.sys.atari.st
Date: 1996-02-10 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <311bddfc1014337@sn.no>
Source record: 150946
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

There's been a lot of talk about installing an IDE type harddisk on the ST, a lot of going back and forth- some people say it's possible, others have said that there's no such thing, so here's what I've picked up...

Several companies (most notably in Germany) have advertised about having IDE interfaces that allow you to use a PC type harddisk instead of the more usual SCSI ones with a host-adaptor which most Atari users with harddisks are using.

They would also allow for 2.5" harddisk units which could be installed *inside* the ST itself taking it's power from the ST itself. This would further reduce the price because you wouldn't need to buy the power supply and the external case.

So what's available out there?
Well, I was hoping to get one installed in my STe, but have had no such luck. The STe as many might know has a different styled CPU (Motorola 68000 in case someone wasn't sure ;-)) than the usual ST. The CPU is the same, but is square shaped (PLCC) while the older ST type CPU is of a rectangular shape (DIL).
One should think that the only difference was only the mechanical aspect then, but I'm not really sure...

A company called 'Gellermann & Fellmuth' advertised two boards that supported IDE hard disks:

the 'Ideal 2.06' for DM 89,- and
the 'Ideal RTC' for DM 149,-

Both boards would support IDE hard disks as well as CD-ROM units of the ATAPI standard. They would both come with 'HDdriver' and CD-ROM software, and both of them would allow for TOS 2.06 upgrades using sockets on these circuit boards.
The 'Ideal RTC' had in addition a battery backed realtime clock (which amazingly enough the ST is lacking).

I found this ad. in the German magazine "ST computer" (April 1995) and immediately wrote them a letter. After several weeks of no reply I tried again, and then a third time. I even got an email address from a helpful German soul on the net to one of the company owners. I've never received any replies.
I even gave the fax number to someone else on the net who tried to contact them that way, but they never replied him either.

I have no idea why... maybe they're not interested in doing business,
maybe the company has closed down...

I've also been told by a friendly person on the net that he has
actually seen this interface installed in an STE as there apparently
was a special STE version available at some time. He wasn't able to
get in touch with the company either.

Anyway, the address (in case someone wants to try);

Gellermann & Fellmuth GbR
Frankenbergstrasse 38
D-12589 Berlin
Germany

Tel: [+49] 30-6480 479 (within Germany: 030-6480 479)
Fax: [+49] 30-6481 271 (within Germany: 030-6481 271)

Now the second company that I've seen advertise IDE interfaces for the
ST is the rather famous Hard & Soft which has been selling all sorts
of Atari add-ons for a long time.
I wrote them a letter and got their catalogue which among many
interesting things shows an IDE interface which they call the
'AT Bus TOS card 2.06'. As you probably understand from the name, this
too is an interface that allows IDE harddisks to be connected as well
as a TOS 2.06 upgrade.

In my catalogue (from April/1995) the price is shown as:

'AT Bus TOS card 2.06' (without TOS 2.06 ROMs) DM 99,-
'AT Bus TOS card 2.06' (with TOS 2.06 ROMs) DM 179,-
(German TOS I presume)

The interface comes with SCSI tools 4.xx Junior software.
It is also noted that the following items are available at prices
given upon asking:

- Adapter for 2.5" drives (a cable adpater I presume)
- Adaption kit for Mega ST
- SCSI tools (full version) + harddisk cable
- Adapter kit for STE

Well, a very helpful dealer here in Norway contacted them for me and
was told that they didn't sell an STE version after all!
(makes you wonder why they advertise something they're not selling),
but the ST version should apparently be available.

The address to Hard & Soft is:

Hard & Soft computerzubehoer GmbH
Obere Muensterstrasse 33-35
D-44575 Castrop-Rauxel
Germany

Tel: [+49] 2305-18014 (within Germany: 02305-18014) Mon-Fri:9:30-13/14-17:15
Fax: [+49] 2305-32463 (within Germany: 02305-32463)

The final company where I've had some hard proof of availability is
the publisher of (among others) a German computer magazine
called: C't.
They've had several do-it-yourself (DIY) articles through the years
for different computers, and one of those articles is about how you
can make and install an IDE interface in an Atari ST.

A blank PCB and a pre-programmed GAL chip can be bought from the
publisher as well. The rest of the parts are more or less common
parts, though I found the 'wire wrap' type sockets a bit hard (and
expensive) to get hold of.

The interface functions in the same way as the above mentioned do and
also (like the other ones) doubles as a TOS 2.06 expansion board. This
version of TOS is actually needed if you want to be able to boot from
the harddisk (most of us do want to boot from the harddisk when we get
one I guess), but if TOS 2.06 isn't used you can boot from a diskette.
TOS 2.06 can always be added later I guess, but I'd highly recommend
it anyway since it changes your machine completely and you'll never
want to go back to any older TOS versions after having tried it!

The article about it (in German of course) can be bought for... (I think
I paid DM 4,- but don't quote me on this) and was featured in
issue 9/1993 of C't.
The article was titled "IDE adapter fur Atari-ST" (page 170-173).

IDE adapter PCB (approx. 48x85mm) DM 26,-
IDE adapter GAL chip (pre-programmed) DM 19,-

As for software, AHDI 5 supports IDE and can be downloaded for free
from just about any FTP site.

The address to the publisher of C't:

EMedia GmbH
Postfach 61 01 06
D-30601 Hannover
Deutschland

Tel: [+49] 511-53 72 95 (09-12:30)
fax: [+49] 511- 53 52 147

That's all the info I have on the matter, but I'd like to know more.
Most of all I'd like to know if there is an IDE harddisk interface
that works for the STE and where it can be bought. I'd also like to
recieve feedback on availability/use in general.
And if anyone can get in touch with Gellermann & Fellmuth and hear if
they sell those interfaces for the STE I'd be more than interested!

The above mentioned interfaces should all work fine with the usual
older ST machines (ST/STF/STM/STFM/Mega) but not STE/MegaSTE as far as
I know. If someone has succeeded in getting them to work with the

latter two machines I'd really like to hear about it.

Hallvard

D > loads in approx 3 seconds.

As I recall, the question before the house was how much memory pgs
had to deal with. How much memory do you have in your TT? Mine has
4/0 and PageSTream loads in about 5 seconds.

The reason I ask is I am planning a ram upgrade, and don't want to
go too far - I depend heavily on PageSTream.

Since this question came up, I'll ask this:

I _thought_ I saw, in a catalogue somewhere, a networking program for the Atari that used Appletalk. If this is the case, wouldn't it then be possible to utilise the Appletalk portions of the Novell suite?

Mind you, I _could_ have been hallucinating(it was _good_ cough medicine...)

I haven't seen that software, but if so it might be possible.

But maybe not. As I understand it you need to add a Novell client
to Macs to use Novell volumes whatever you have on the server. You
can get Novell to work over localtalk but the higher level protocols
it uses are the same as normal and still need special software.

Why? What if you want to use MiNTnet and still want a nice desktop.

In fact installing MiNT and not installing a replacement desktop would be
silly, as the standard desktop doesn't handle long filenames.

MiNT doesn't take much memory.

so how do you go "on-line" without setting up SOMETHING ??? So if you have to
do that (If you get access to the net just by switching on your atari then this
is a very much undocumented feature <G> and you must share this with us all !!)
then why nmot set up the best system .. and that is MiNT .

> other stuff one does with their computer not only does not require it,
> but does not run well under it?

you have a boot manager ?? MiNT should conflict with very little well written
software but I am not arguing that you may have to reconfigure depending how you
set it up ..

Were not some of the serial routines supplied by Jan Kriesten who also
wrote Semper which has a same requirement (I.e HSMODEM requierd)

Having said that HSMODEM is very much a desirable include anyway , fixes
all needs for other patches .....

Regarding magic I don't know about v4 as it is not ready until next week
in the UK :-(but the manual for v2.0x states that whilst some routines of
HSmodem are used in the Magic Kernel not all were and it was still advised
to use it .

I'm looking for a hard drive which can be plugged into my Atari
520ST. This would probably require a SCSI drive, but would definately
require the Atari DMA adapter.
Anything over 20 megs should do -- all I need is enough to get
MiNTnet and X windows installed and working.

Washington, D.C. metro area perferred, but at this point it
doesn't matter. I just need a cheap drive ASAP.

Yeah sorry, wasn't a very clear question.. I'd been up all night...
Firstoff it reckons there's an error in mint.cfg..

..*PID near: h* (the rest's off the screen)

Then it set's slip and ppp going.
Then it say's..

starting network daemons [: no such file or directory (twice)

Then now nohogs installed it hits the desktop. Opening windows etc
is fine, but it crashes as soon as I click on a file. A string of
messages come up that change each time PC= textbase= etc etc.
It usually gives the code _2560_ or _2816_ when leaving mint...

I may well have missed something vital when installing, I followed
the mintnet faq but don't have a clue really... I haven't the space
for the distribution sets, <6meg on the hd is the limit really.

Cheers,
Smn..

No, surely the shell is the client, which is asking your terminal software, a
server, to display some text for it :)

Here we go again another asshole that wants programs to be only in
their language . Number one , France is a small market so really we
shouldn't be worried about translating anything in french at all .
Maybe we should be doing like the Germans are and totally forget that
North America even exists . No wonder people are switching platforms
when they can't even get material distributed in one of the major
languages of the world ie : English
P.S. Nous aussi on est francais dans se coin ici mais ont aimerais
recevoir notre programmation en anglais !
BTW. I do my own translation of german programs but it sure would be
nice if the programmers took into consideration the major languages
when they release their programs when you consider the costs we are
paying for some of these .

Is someone still working on this program? Just curious. There was
alot of splash about it a month or so before STiK came out, then there
never seemed to be anything more of it. The version that is up is really
barely functional as it wouldn't load most of the simple pages I have on
my hard drive at home.

Just curious,

Dan Ackerman
aka baldrick

I only use CBHD. It's excellent. I use it on an old ST as well as on a
Mega STE. The newer versions come with a lot of documentation. I'm not
sure, it might be in german.

From: chriswil@southern.co.nz
Message-ID: <4fjn7e$78b@orm.southern.co.nz>
Source record: 150772

Hi There...

I am considering installing MiNT 1.12 and MiNTnet (whatever latest version) to run the CAB WWW browser via the new MiNTnet overlay file. I need to know a few things. The MOST important question is Where can I find a non-corrupted version of the MiNTnet archive. The version I tried was from wuarchive.wustl.edu and was corrupted. Secondly why can't these archives be supplied in simple ZIP format, instead of gnu-zipped TAR files. Some of us don't really have the patience for stuffing around with several archive utils just to depack ONE file!! :-/. Thirdly, are there any GOOD english GEM based MinTnet install programs. Some of us , again, don't have the patience for mucking around with dozens of files just to get stuff to run...

Ciao, Chris W.

> Also I don't quite understand the ins and outs of running the clients...
> Using the mintcab.ovl do I boot through mint into gem and run cab as with StiK,
> or is Mintnet only available through the command line... what do I have to do
> with CAB to get it running?
>
Of course MiNTnet is also available when booted into GEM. But there is a
trap : MiNTnet needs working threads (multitasking), which normally is
blocked because the GEM AES stay in supervisor mode. You need to have
NOHOG.ACC or GEM_IDLE.ACC installed to cure this.

Cheers Peter

Phil Hough (phil4@phil4.demon.co.uk) wrote:

>Does anyone know of a program that will get rid of the extra LF/Line
>added on what seems to be most UNIX text.

You can use specific programs for this purpose or simply load the Unix
end-of-line text into a text editor and save again! All text editors
save in the CR/LF way, so if you save the etxt again it'll be in the
Atari CR/LF way instead of the Unix LF way.

By the way, if you want to turn a text into Unix again you might also
use some text editors which can save text files this way (Everest and
the latest versions of 7up do this.)
Just select the save option with "LF" instead of "CR/LF".

There are also specific programs which do the conversion. most notably
"unix2st" which contains two .TTP command line programs- one is called
"unix2st", the other one "st2unix" I don't think I need to explain
which one does what.

You simply double click the one you want and enter the filename of the
file you want converted. I've found it *very* reliable, and I think it
even retains the date/time of the file instead of updating it.
I think you need to run the .TTP program in the same folder as the
file(s) you're converting.

The following programs are available by FTP at:

ftp.sn.no /user/hallvart/atari/

evrst35e.zip (Everest text editor) 126 Kbytes
unix2st.zip (Unix2st/st2unix) 45 Kbytes

I also have two versions of '7up', but the one which supports Unix
end-of-line saving is a huge one, while the smaller one only supports
Atari style end-of-line (but it still a great editor).
I'll try to get version 2.2 uploaded later.

7up232.zip (7up text editor 2.32) 824 Kbytes (with a TEX file)
7up_209.zip (7up text editor 2.09) 115 Kbytes

Well, any umich or hensa mirror site has most of them...but IMHO you
could go another route. You could get the "All Things Falcon" CD-ROM
which has -tons- of Falcon demos on it...they are not compressed and
nothing on the disk has to be run through an emulator (like Backwards)
Save yourself the online time and expense. I got my copy just the other
day and it was only $19.99! (this, of course is assuming you have a
CD-ROM drive!) 'Luck!

PS BTW, I appreciate -anyone- who stands up for
the Falcon and what a great machine it is! Kudos
to you, my friend! :)

I have 2 external SCSI Drives one is like 600MB the other is like 500MB
or so. They are currently PC formatted. Note these are professional
LAN stack type drives which work great. Ill part with them for $400 for
the 500MB and $500 for the 600MB They are standard SCSI so any host
adapter should work with them.

:). Yes, Karl, I had a go on an STM. It wasn't a pleasant experience as I managed to install the driver on the HD but then found that CBHD didn't seem to understand the ICD partitioning I had on there and I lost access to all partitions other than the first! I had to use the ICDFMT

"Partition Info Only" option to get back the lost partitions so DO remember the start/end sectors of your existing partitions before you try it. I did this after only a very quick scan through the docs so I almost certainly did something wrong. CBHD deserves a better trial one day!

Forget how I did the install now. I think I ran the prg in the package which had a rsc file. There was a menu entry which offerred "Install" and I clicked on one of the disc icons displayed. Quick flash of the disc activity LED and I was up the creek :(

Help Its Driving Me MAD !!!:

Since STF 79 came out, there was a game on the coverdisk called, Trapped 2, a lightcycle (as in TRON) game. I've played it a couple of times since then, including last night. This evening I come to play the game and it won't work. It loads up fine, and allows you to change all the options, then when you go to start the game, it goes fine, until its about to start drawing the 'cycles' as they set off, and it just freezes, with the sound effect of a locked game !

What makes this more strange is that I literally turned the computer off after playing it yesterday and then turned it on this evening and tried to play again. Nothing has changed, the hardware, the software, nothing.

Things I've tried and ruled out:

i) Conflicts in ACCs and AUTO progs - not possible, there aren't any
ii) Duff disk, I tried running it from Harddisk, same problem !
iii) Corrupt Software - I re-installed it from the original archive
iv) The date - moved it back a day, to yesterday
v) RAM - all is fine, and there !
vi) Won't run from HardDisk - won't run from either ! I tried

I cannot think what might have changed for the problem to occur, and it is soooo annoying !!

For info my Setup: MegaSTE with 4Megs RAM and 48MBytes HDD, Colour Monitor, TOS 2.05.

BTW: the program appears to have been written in GFA Basic, 3.5

Hello guy@swampdog.demon.co.uk...

g> Expire everything with a time limit of zero so that its all gone,
g> then get a text editor to NNTP.DAT and manually change the time and
g> date back to the time you want the news to be fetched from. The first
g> line looks like this ...

Aha!! So this explains why when you have first installed NOS that you get
about two weeks worth of messages on your first session!? .. or is it just
me? ;-)

If this is the case.. and it doesn't mention it in the Oasis docs then it
should! The first time I used Oasis, I joined 12 newsgroups before I made my
first session and it took about 1.5 hours to collect all the backdated news!

r> anyone have any screen shots that might convince me? Maybe
r> applications and a screenshot of MagiC? Thanx.

There is no way that screenshots would convince you to buy any computer...
not even a PC! The only real way to get the idea of what software is like is
to read a review or actually see it running.

Also, MagiC is invisible.... it sits in the background.. therefore it is
impossible to have a screenshot of it <g>

2946. Mintnet...help!

Newsgroup: comp.sys.atari.st
Date: 1996-02-11 00:00:00 UTC
From: simon@orme.u-net.com
Message-ID: <824085912_OASIS_@orme.u-net.com>
Source record: 150815
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

I've been attempting to install mintnet (without a minix party.. no room)

The faq and mint docs contradict each other a bit regarding paths..
I've set up the uni dirs and done the domain/host stuff ok.
Mint runs if I boot into sh.ttp but crashes with a load of errors if left to run into gem/thing.

Even when it hits sh it claims there's an error in mint.cfg. While it starts the protocols it also seems unable to find a couple of other things, it doesn't say what, just prints unknown path/directory.

I'm using net072 and Mint112.

Basically I need to know what should be in the mint.cfg and where the various progs should be put \bin or \usr\usb... if that's what it's looking for after the protocols are run.

Also I don't quite understand the ins and outs of running the clients...
Using the mintcab.ovl do I boot through mint into gem and run cab as with StiK, or is Mintnet only available through the command line... what do I have to do with CAB to get it running?

Any help or better docs appreciated...

Cheers,
Smn..

> and where can we get the required bits from?

I supose the question ought to be - what purpose are you networking these for?

If you've real money - then several options have been sold in the past. I honestly don't know much about them - as they were all too expensive for me.

On the cheap - the best bet IMHO is MiNT-Net - which is a freeware TCP/IP implementation ontop of MiNT.

The bigest problem with MiNT-Net is that the ST has no suitable network port for multiple machine LANs - so something has to added. There are MiNT-Net drivers and plans for a IBM PC type DE600 parallel port adaptor which would allow you to use ethernet. The server in this case could be anything that talks TCP/IP over ethernet and supports NFS. A PC running Linux for instance. It could of course be one of the STs though.

The DE600 seems to be freely available at the moment - despite really being a bit obsolete. However you would have to have the interface card made up. It doesn't seem to be available pre-made. Its a fairly basic PCB with a few $ worth of chips. Plugs into the cartridge port.

There is also some talk of using the MIDI ports which would achieve similar results - though much much slower.

Hope that helps.

I'm planning on building the DE600 card for my TT - so if you need more info I might be able to help out.

:-)

Roland.

2949. Gemulator and Calamus

Newsgroup: comp.sys.atari.st
Date: 1996-02-11 00:00:00 UTC
From: ab078@sfn.saskatoon.sk.ca
Message-ID: <4fjlo7$st1@tribune.usask.ca>
Source record: 150818

I currently own an ST and Calumus 1.09. Sometimes I get frustrated
waiting for the screen to redraw when moving around the page. I would like
to be able run Calumus on a faster machine. Is Calamus compatible with
Gemulator? I'm wary of buying a Falcon to run it on, because I wouldn't
have anyplace to take it to if it needed repairs. I also have a 486
SX-25. Would this run Calamus faster than my ST?

Hello John...

c> Hi all,
c> I am new to this group and was wondering if
c> the atari st is still supported and how/where
c> can I get software.

Yep... it certainly is still supported.. and always will be while people keep
using their machines!

You can get public domain software from, among many others, these ftp sites:

atari.archive.umich.edu/atari/
micros.hensa.ac.uk/micros/atari/

You should also go and buy an Atari magazine from your local newsagent to get
an idea of what shops there are, and what software is available from them.

>config.

Noted thanks.

> Unbatching such a file not only bombs, but also corrupts in some way
>the message base... or at least loose a single message.

My experience also. Reindexing can help though sometimes it fails.
Usually, it is easiest to just expire the lot and try again.

> Cure: first deselect the local post button in Oasis, put a very great
>delay in the addserver command (I use 60000, never been online more than
>16.6666 hours at a time!), then test (and remove) with a text editor the

I've not used the local post option fortunately.

> But there could be a problem: I use XXEDIT the hex/ascii file editor
>for this, because text editors could corrupt some articles... cutting out
>some characters from too long lines, or deleting trailing spaces, etc...
>Most editors cant handle lines more than 256 chars long. Everest go up to
>300 chars. I've seen lines of more than 500 chars long in articles...

Protext seems capable, at least so far. The last news RFC I read says
that space for a 512 line should be available - I can't recall what

the required action should be when this is exceeded - truncation I
suppose.

> And it's not good, you cannot add/remove a single char from the
>articles in the batch.txt, unless you modify the rnews value... which is
>actually the length of the article, but counting CR+LF for one.

I've messed with this a little and I tentively suggest that Oasis 133E
(at least) ignores these values, looking only for rnews and "Lines:".

I can't remember but it seems a natural deduction unless the
installation program (which I did not run) updates the stamp.

>If this is the case.. and it doesn't mention it in the Oasis docs then
>it should! The first time I used Oasis, I joined 12 newsgroups before

Use the "New Groups" option. There is also a list maintained daily on
ftp.demon but this needs modifying to be "NG" compatible.

I just bought NVDI (2.5 for STE) and it works like a charm. It really
speeds up things. Solid. Compatible with old buggy TOS progs & Cubase etc.
Well worth the $60.

What the difference of installing MagiC onto HD, or EPROM. As long as only you (the licence holder) uses it and only have one copy installed. I can't see the problem.

>
>If it is a complete replacement, what is to keep the developer from

Just an idea, but maybe the developers of MagiC could blow it onto EPROM. If so what stops them blowing Magic MAC onto EPROM and using MAC (or MAC Clone) hardware. As I said, just a thought.

Due to a missing host name, I have no idea where in the world you
are located at! So, your best bet if yoou are in the US is to get a nice
external hard drive case setup from Toad computers with an ICD AdSCSI+ in
it! This gives DMA in and out and a 50 Pin SCSI out port also! Shouild
take care of all your present needs and simplify things if you later want
to add something like the new Syquest EZ135Meg removable to your system!

Message-ID: <824128140_OASIS_@phil4.demon.co.uk>
Source record: 150837

Does anyone know of a software way of 'turning the fpu off' so that
any program thinks that one doesn't exist ???
I have an FPU fitted, but a couple of progs, hang when run, with it
instlled, remove it and they run fine, so I'm looking for something
that would make them think that it isn't there !

Using the cookie jar perhaps ??? any progs that anyone knows of ???
any suggestions ??

Thanks in advance !

Message-ID: <824129012_OASIS_@phil4.demon.co.uk>
Source record: 150838

In article <4fjl13$st1@tribune.usask.ca>
ab078@sfn.saskatoon.sk.ca (Travis Kern) said:-

>I would like to know more about NVDI. How does it compare to Quick ST
>
below is a comparisson using Gembaench of speed increase figures, and
also my recommendation, hope it helps !!

My Machine Specs:
==========
Mega STE TOS 2.05
AES v3.10
GEMDOS v0.25
MiNT not present
Blitter Enabled
Video Mode: 640*400*2
I/O mapped FPU installed
Run and Malloc from STRAM
Ref: MSTE + Blitter + FPU, ST High

NVDI 2.5 QUICK ST 3
==========
GEM Dialog Box: 1.585 288% | 1.480 308%
VDI Text: 0.745 672% | 0.765 654%
VDI Text Effects: 1.960 625% | 1.695 723%
VDI Small Text: 1.045 524% | 1.015 540%
VDI Graphics: 3.665 388% | 13.505 105%
GEM Window: 0.900 146% | 0.870 151%
Integer Division: 0.000 ---- | 0.000 ----
Float Math: 0.000 ---- | 0.000 ----
RAM Access: 0.000 ---- | 0.000 ----
ROM Access: 0.000 ---- | 0.000 ----
Blitting: 1.475 117% | 1.780 97%
VDI Scroll: 1.840 217% | 1.890 211%
Justified Text: 3.100 157% | 4.930 98%
VDI Enquire: 0.870 191% | 1.595 104%
New Dialogs: 3.075 187% | 2.260 255%
==========
Graphics: 319% 295%
CPU: 0% 0%
Average: 319% 295%

As you can see, in terms of acceleration they are pretty much the
same, however there are some things, such as Blitting, and Justified
text that Quick ST 3 doesn't handle.

NVDI also includes a replacement for GDOS, which is faster and easier to use. The above test is only with NVDI 2.5, the latest version (3/4 ??) is faster, and also has much better version of GDOS.

QuickST 3 is now very old, and IMHO worse than NVDI. My recommendation, get NVDI !

>
Normally with client/server technology you're talking about processes
(software), not maschines ! The server is a process that provides some
sort of service; a client is a process that makes use of it. Both may run
on the same maschine !
Talking about X, the X server is the process that provides the service of
a graphics environment, while the client asks the server to fill the
windows with something that makes sense.
Therefore of course the maschine you're sitting at executes the X server,
because it's you who wants to see the graphics output; while the (possibly
remote) maschine executing some application software executes the X client !
There is nothing "the other way round from normal networking terminology" !

> In normal networking technology - the workstation on the user's desk is
> the client. It is serviced by the server - which is normally some form of
> central machine.
>
Now apply the definition : You're running some sort of terminal software
on your desk's maschine, and maybe a shell on your central maschine. The
shell is the server, not the central maschine. Vice versa : The terminal
software - not the actual terminal (the maschine on your desk) - is the
client. See how it fits ?

> With X, the workstation is the server as it is servicing X requests from the
> client applications - which often are running on a seperate box. Many
>
See it from your own words : client applications. You're talking about
software, not maschines.

> This might be all obvious to you - but many people consider the terms
> client/server to be reversed around under X.
>
It actually occured the first time to me that someone saw it this way !

I don't understand why not. I used to have TOS 1.62 on my STE but I've
had TOS 2.06 for a few years now, so I can't really remember.
If I drag a disk icon to the trashcan I'm asked if I want to remove
the icon from the desktop or delete the files.
I don't understand where you get the "format the disk" comment from..
Are you sure about this? I'm sure that the above mentioned is correct
for TOS 2.06 as I just tried it (with the disk write protected just in
case of course!). And I keep the warning options off when deleting
files.

IMGs feature a rather good compression, IF IT IS USED ! The IMG
definition also allows to have an IMG without any compression. I often
notice as a consequence that the same picture just loaded by a different
program that it was created, and saved again, produce different file
size. So just try to read your file with a little drawing program, for
instance, and save it again. It might shrink to a few hundred kilobytes.

Cheers Peter

And the really crap thing is that the AdSpeed 16Mhz accelerator
from ICD was out years before TOS 2.06 or IDE drives and Atari used the
same device identifier for the IDE drives that ICD had already used for
the AdSpeed, so I have to wait for the darn thing to time out every time
I boot up!

I often do the reverse. All you need is a text editor that will do
find and replace. You want to change all the 13,10 into 13. I'm just
going from memory here, I think that's the order. Try it once and if it
doesn't work change it to 10. The numbers here represent the decimal
codes or CR and LF.

I use Edit Pro(aka EdHak).

I am not sure, but I think your only bet is to use something like
Edhack or Edit plus and do several search and replace operations on a
copy of the file to change the command codes over to a format that the
other program can undersdtand! I know this isn't what you wanted to hear,
but I.ve had to do this myself recently!

You may have a point re free space on the HD. I have now cleaned up the
partition on which I have OASIS and things seem to be better (maybe I shouldn't
talk too soon !).
With regard to the 'EXTERNAL ERROR' message it may be something to do
with the instalation of the built in editor. Looking at the TOOLS set up
dialogue I noticed that although the OASIS calls for the full path of prgs used
in the toolbox the inbuilt prgs such as the editor do not show this. I changed
the TOOLS.CFG file to show the full path and since then things have been OK

I was able to un-lzh it, but it doesn't seem to do much... I played with
it for about 10 minutes, and couldn't figure it out. No docs, and everytime
I tried to do things with it, the buttons acted really odd (like I would
press a button, and rather than getting a new dialogue or whatever, as I
would expect, the button would just stay depressed and nothing would happen).
Looks like there is some configuration, but be damned if I can figure it out...

2987. Re: what is a good picture viewer?

Newsgroup: comp.sys.atari.st
Date: 1996-02-12 00:00:00 UTC
From: Guido Vollbeding <guivol@esc.de>
Message-ID: <4fo6u5$8ik@taiwan.informatik.uni-rostock.de>
Source record: 150656

Since your picture viewer will probably have to deal a good time with
decoding JPEG images, you should have a look at the latest version of
Tom Lane's JPEG-FAQ, available at

ftp://rtfm.mit.edu/pub/usenet/news.answers/jpeg-faq/part1
and
ftp://rtfm.mit.edu/pub/usenet/news.answers/jpeg-faq/part2

or for reading via WWW:

http://www.cis.ohio-state.edu/hypertext/faq/usenet/jpeg-faq/top.html

Part2, Subject [10] and [15] give system specific hints which programs to use
particularly on the Atari and where to obtain them :-).

Guido

2988. A4 flatbed scsi scanner drivers for the atari....

Newsgroup: comp.sys.atari.st
Date: 1996-02-12 00:00:00 UTC
From: "Dr Simon G.K. Williams" <williamssg@cf.ac.uk>
Message-ID: <DMoDH7.oGx@cf.ac.uk>
Source record: 150657

I know that its possible to link up an Epson GT6500 or GT8500 flatbed colour scanner to the atari and scan in truecolour using the GT look software. The prob is that these scanners are very expensive when considered against what's currently on the pC market.
In work I'm using a Trust 2400 dpi flatbed, it only costs ï¿½299+VAT and does a superb job. It's scsi, so question is can it be used on an atari? What I want to know is, does anyone know of any suitable GEM tidily written scanner drivers (magic and graphic card compatible) that will work on some of the cheaper colour flatbed scsi scanners available. Any help would be very much appreciated.

Simon

I've heard than Sileibus 7 for Acorn RISC OS machines is a market leader in its class. I prefer to use Acorns for DTP/Wordprocessing because the software is excellent and the GUI is absolutely fantastic. I wouldn't recommend buying a PC as they are slow, particularily Word (infact its so bad I'm considering bringing my TOS 1.2 ST up from home - quitting applications to go into others would still be quicker than using Word).

Hope I've been of some help.

Yes, but you could try changing the '_FPU' cookie so that programs that
test this decide not to use the FPU, and to use software routines
instead...

Just a thought...

2993. NVDI 3 with Screen expanders ???

Newsgroup: comp.sys.atari.st
Date: 1996-02-12 00:00:00 UTC
From: dhbutler@stat.mps.ohio-state.edu
Message-ID: <4fodnm$npt@osustat.mps.ohio-state.edu>
Source record: 150662

I have been attempting to use NVDI 3 with MultiBlow (RGB monitor overscan) and the DEMO version of BlowUP (while I wait for a full version from TOAD). However, I can not get NVDI to work with either product, regardless of load order. Just for kicks, I also tried it with my Mega-4 and ISAC card, and once again it did not function! Warp 9 works in all cases (too bad it is so much slower!). What is going on here? I was under the impression the NVDI worked with such screen expanders... Could the problem lie with Geneva? (Seems unlikely, it works with everything else I have...)

Thanks,

2997. Atari ST + the IBM

Newsgroup: comp.sys.atari.st
Date: 1996-02-12 00:00:00 UTC
From: schmoo@pathcom.com
Message-ID: <4foe70$r44@pathway1.pathcom.com>
Source record: 150666

Hello!

I am the proud owner of both an Atari ST (low/med res monitor) and an IBM-compatible, a 486DX33 (SVGA). In my time, I've run an Atari ST-based bulletin board in Toronto, Canada, and at some point, somebody uploaded a piece of software (I still don't know if it was public domain or not) called PC:DITTO. I never did get it to work, but apparently it was supposed to emulate an IBM instead of using TOS.

My question is this. Now that I'm using the IBM for a lot of my work at business, I'm kind of missing a lot of the great games that I once played. The Atari is getting kind of glitchy I've noticed, and I'm really annoyed that such games as SUNDOG: FROZEN LEGACY, MONTY PYTHON'S FLYING CIRCUS, and many many many others that I paid good money for are going to go to waste.

Is there any way to run this software (short of re-buying the IBM versions) on an IBM that anyone knows of? I am feeling kind of doubtful that I could actually run anything right off of the diskettes, but I would easily be willing to settle for an emulator which I could use to translate Atari ST software over a modem connection or direct port connection.

Any ideas or suggestions? If so, please e-mail me directly at my address below.

Thanks,

Derek.

Date: 1996-02-12 00:00:00 UTC
From: dhbutler@stat.mps.ohio-state.edu
Message-ID: <4fobch$n94@osustat.mps.ohio-state.edu>
Source record: 150667

I would like to use my ZIP drive to read DOS format ZIP disks. This will allow me to easilly exchanged data with my Mac, which can read that format with AccessPC. Apparently a new German HD Driver will do this, but I already have ICD Pro and have been happy with all previous versions of the ICD software (which I've been using now for about, what, 8 years??). Anyway, I would like a way to do this without replacing my HD driver itself. Anyone been able to do this?

=Thanks!

3000. MiNT on Falcon (many troubles ;-)

Newsgroup: comp.sys.atari.st
Date: 1996-02-12 00:00:00 UTC
From: dhbutler@stat.mps.ohio-state.edu
Message-ID: <4foc1q$ne4@osustat.mps.ohio-state.edu>
Source record: 150669

I have trien a number of times to install MiNT from the 9 disk distribution set which I downloaded from Toad's umich mirror (thanks TOAD!). Anyway, I have had no luck whatsoever getting it installed. Running in 'ST High" video mode allowed me to make it into the setup program without crashing, but I get an error part way though and the system bombs. I did not that the readme file refers to a 16mb partition or smaller. Is this really necessary? I'm running a .5gig drive, and obviously I don't want to have a bunch of itty bitty partitions... Eventually I want to use this with Geneva. The recent Geneva update clearly refers to a "mint.txt' document, which is supposed to include instructions about using Geneva and MiNT gogether. However, this file is not included in the Geneva update I downloaded (I even downloaded it again to be sure). Where do I find this? I am *not* a unix wiz, but it looks like Mint will allow me to control such things as background priority etc... Is there any way to do the install manually?

Thanks for any help you can give me.

From: Howard C Johnson <howard.c.johnson@att.com>
Message-ID: <311FE0B0.41CB@att.com>
Source record: 150673

I am looking for a good home for my Atari System.

Atari 520, and 1040
4 HD
CD rom
MAC emulator on 1 HD.

Endless software.

Free to a good home. (but you have to pay to ship it).

Send me mail - preferred.

howard.c.johnson@att.com

Howard

I've contacted 2 people I've found in this list that seem to be
still using these older machines; no response yet.

For all, Snappy is a dongle that hooks on to a PC's parallel port and allows you to capture still images from a video camera. Well, there's no reason I can see why software couldn't be written for an ST just like there's flatbed scanner software. Maybe the gurus that wrote GT-Look II could handle it. Since it is a parallel port device I imagine it itslef has to be fast enough to do the captures as an 8-bit port probably couldn't communicate quickly enough to do what it's doing -- capturing images on the fly.

I have some Atari-related items for sale. These prices are not solid.
If you make a reasonable offer, I will sell it to you at your price.
Shipping is not included, and I will only send COD. It would be best to
respond to me in Email at: millert@grad.csee.usf.edu

ATARI FALCON, ETC: $700 (all together)

Falcon, 4 megs, 85 meg HD
All the software that comes with the Falcon, including Atari Works, etc.
Geneva and Neodesk 4 (actually, a copy that was given for review)
Video connectors for VGA, RGB, and composite.

BOOKS, PROGRAMMING:

Atari Compendium. ($20)
The last two versions of Lattice C. ($50)
A collection of Abacus books, including Atari ST internals. ($20)
Laser C ($20)

OTHER SOFTWARE:

dbCalc 2 and ElCal, two junky ST programs ($5)
Warp 9. (Falcon and ST versions) ($10)
Universal Item Selector 3 ($5)

ATARI ST:

Mega 2 ST ($150)

HARD DRIVES FOR THE ST:

45 meg seagate ($20)
42 meg quantum (stuck) ($5)
ICD SCSI controler+cable+software ($20)
Case and pwr supply ($30)

J Golick <73217.3246@CompuServe.COM> asks:

> Can a fax be sent directly to the Atari without
> resorting to a phone line? That is, from a PC with a fax modem
> directly to the ST?

Yes, just as easily as you can send a fax from one PC to another without using a 'phone line: all you need is a specially adapted telephone cable with a battery and resistor attached to simulate the voltage sent by the exchange, and a means of fooling the called modem into thinking it's receiving ringing current (e.g. a hand generator from an army surplus telephone). Or you can use a simple home PABX.

Try asking on comp.dcom.telecomm, there's people who do this all the time ... :)

> transfer the text to either a mac or a PC. I have no idea on how this
> would be done but I could see a simple utility being possible. Is there
> one around?

Okey dokey, well the way I do them is this:
TO PC: If you have TOS 1.4 or above (ie when you click 'Desktop Info',
the Atari logo is rainbow coloured), disks are already formatted to
MSDOS. Below TOS 1.2, you need a program which will format MSDOS.
Save the First Word file as ASCII (ie the 'WP Mode' tick is off). Load
into your PC!

TO MAC: Well, firstly make sure the disk is formatted to MSDOS (see
above). With older Macs, you require the Apple File Exchange, which
transfers files between MSDOS and Mac formats. Newer ones (PowerMac,
Performa, Centris) can load them up onto the Finder straight away.

Sorry if this is long-winded but I hope it helps!

AP> I import into Atari Works I just have lines of text!
AP>
AP> Any ideas would be appreciated!

The original LDW disk (mine at least) contains a folder called LDWCNVRT which
contains an Lotus 123 converter. Works very well.

Hi all,I just had a couple of questions-

#1 is the text editor 7-up still being worked on? I just d/led it
and the search and replace functions are even faster than LeRedacteur!
Unfortunately it will not print with Speedo GDOS.

#2 Has anyone had any problems with using a US Robotics sportster modem with
Stik?

I am just getting a modem status of 'Unknown' even when it connects.

thanks!

: Rod McCall (rmccall@mcs.dundee.ac.uk) wrote:

: : What about Thats Write? Is it any good for DTP stuff?

: I don`t think That`s Write is flexible enough to do real DTP. It is really
: good for writing diploma works or PhDs for you can have chapters
: automatically numerated and have a listing of contents which I didn`t

Guess I should have bought That's Write then. I must admit I like Papyrus,
but the lack of chapters, good colour handling and a word count is a bit of a pain.

I'd like to see the following in Papyrus 4/5:

good colour & image handling (gif/jpg etc)
contents, index etc
word count
thesaurus
good drawing tools (or atleast passable aka Word)

Incidently what's the difference between TW2 & 3?

3019. Drivers for Cannon BJC210 wanted

Newsgroup: comp.sys.atari.st
Date: 1996-02-12 00:00:00 UTC
From: aking@bbn.com
Message-ID: <4fm7bf$6b@info-server.bbn.com>
Source record: 150688

My dad just got a new cannon bubble jet, and it won't work with First Word. I just searched DejaNews using "Cannon Color Bubble Jet", filtered on comp.sys.atari.*, and came up with 599 articles, but no help. Where are the drivers kept?

So the questions are:

1. What is the right printer driver to use in this configuration? Cannon doesn't support Atari. An old Start magazine (vol5 #7 apr/may 1991) suggested fx80.sys.

2. Where can I get the driver? If public domain, which Internet archive? If $, who sells it.

3. Will First Word Plus solve these problems?

The Details:

520STFM, upgraded to 4M main memory, TOS 1.4

Cannon BJC210 Color Bubble Jet Printer

First Word 1.06

in auto:
G+Plus Version 1.2
lq1500.prn

With this configuration, everything works pretty well, except First Word, which forgets to begin new lines at the left of the page.

Side note:

About 8 years ago, I got my dad to buy an ST-1040 like mine, and for 4 years, we did fun Atari projects together. Then I moved on into the NeXT community, but he has kept with his 1040. So I'd like to support him, but my head is way out of drivers, so I could use some help from the news group I used to read avidly 5 years ago!

Thanks in advance. Guess I just can't stop reading this group!

Allen King

: This garbled offering from andy@aholt.demon.co.uk to All was spewed forth...

: a> Has the Hensa TOS Newsletter stopped being compiled. There doesnot
: a> seem to have been an update since early December 1995 ??

No, the newsletter hasn't stopped being compiled. I do apologse.. I
just have too much work to do in the Mac section.. i also handle the
Amiga section.. and sadly the Atari section suffers. :-(I do intend
to rectify this, and I am contantly receiving files to go
on-line... there is so much a single person can do though.

I am touched that people noticed its absence... thank you all for your
support.

: The TOP50.TXT hasn't been updated since December 1st 1995 either... and the
: INDEX.CDF is currupted.
: The normal INDEX file is still updated every day though.
: It says on the welcome screen that all of HENSA's options may not be working
: propely at the moment.. and to report any problems via e-mail.
The logs all got f****d when we had the OS changeover. The TOP 50
should be back at the end of this month...

: >combination of STUART DENMAN's 'SPEED of LIGHT' and DMJ's DMJGIF should
: >cover just about every known format with cross-format SAVE options that

: Hey, don't forget GemView, a _very_ good picture viewer!
: It can load LOTS of formats, e.g. JPG, GIF, TIF, (X)IMG,
: IFF, Sun Raster files, Targa, enhanced simplex, etc. etc.

(At least) for monochrome resolutions the best viewer is undeniably
freeware MGIF v5. Mgif also allows one to do all kinds of funky
image manipulation tricks (see
http://www.modeemi.cs.tut.fi/'puujalka/bin/W/logos.tgz for examples).
Mgif understands most of the important image formats (Targa for viewing
POV-RAY output, Jpeg for full color, gifs for < 256 colors and IMGs
for Atari stuff).

As Spofl and gemview are both shareware, I use IMCON freeware image
conversion program for atari formats (<-> gif/tiff).

.TOS extenders in the context of an archive are self-extracting files.

Just run it like a program and you will see...

Hope this helps.

Yes, I have an 8-bit Matrix Coco. Looking for ukp170 but it's been unsold for
a while so if you offer ukp150+postage I would probably sell it for that :-)

Any help?

> guide?

Which version of CBHD are you trying to install? Version 4.50 to 4.54 had a
problem in the installation program (worked only for TOS 2.0x and up).
The 4.55 installer has been fixed.

Generally, a simple procedure without any need for an installation program
is like this:

- Install AHDI
- Copy CBHD over the AHDI executable (SHDRIVER.SYS)
- Reboot

here's a thought. I just remembered - all of the modules are treated as
executables as well. You _must_ use setfast on inport/export modules as well.

That slowed me down too a while ago...

Hmmm. I have 16Mb TT ram and 4Mb ST ram. I used to have a mega4 thought with a T36 accelerator which loaded in about 4 seconds as well... PGS will take all the available memory it can find. With MagiC I have had to use limitmem 'cos it's a bit greedy :-)

FWIW, I use PGS heavily too, the people at work prefer it to Pagemaker. So do I. Need any PS fonts? Got any PD Compugraphic fonts?

Best regards,

Do you realise that you're promising illegal action, that is copying
software that has never been declared free ? In contrary to newer
versions of CBHD (versions before 4.5 are _not_ free), SED is not
freeware, so giving copies away is unacceptable behaviour.
Maybe you should also note that Claus Brod occaisionally reads this news
group.

Hi,

get sed and apply this little script: s/^M$//
where ^M is the extraneous CR-character (ASCII 13, 0xD, \015) at the
end of the line (i.e. preceding the LF).

If you are using vi (Elvis, STevie, etc.) you can apply the ex-command
":s/^M$//". To get the ^M type CTRL-V RET.

>
> I've read lots of stuff about MiNT, and I'm pretty confused. So I was
> wondering if anyone could help me out with some questions?
>
> Is MiNT a complete operating system replacement?

It doesn't so much replace the operating system as enhance it. It adds multitasking to TOS (the operating system layer below GEM, the user interface).

> Do I have to run in a command line interface, or can I float Ease over MiNT
> & forget all about it?

There are three ways in which you can use it. You can forget GEM and run your computer with a cli shell (like tcsh). this is strictly for techies only!

Or, you can keep GEM and run a desk accessory that allows TOS programs to multitask, but GEM has all the usual restrictions (six desk accessories and one application at a time). This is easy to set up and very useful for programming (you can run a compiler using a shell and a GEM editor, like everest, at the same time).

Finally, you can ditch 'normal' GEM and run MultiTOS. This is where MiNT loads a GEM replacement and does not run the GEM in your ROMs. This needs a lot of memory and a fast computer to be useable. It allows as memory applications to run simultaneosly as your memory allows and provides support for drag-and-drop. So you could run Ease and use it to launch an application. You would then see the Ease desktop and windows beheind your application's windows and be able to use both at once.

> If I want to run a program that doesn't like MiNT, is there a way of turning
> it off? Or do I need to reboot?

You would have to reboot.

> Does MiNT slow the system down any?

Yes. How much it slows down depends on the number of tasks that are using cpu time.

> Does it eat up huge amounts of disc space?

No, but all the support programs you could have (for example, a CLI shell) eat up space, if you let them.

> What are the advantages of installing it?

It is brilliant for programing and for using .TOS programs allongside GEM applications.

> What do I need to install a basic MiNT setup? I've downloaded KGMD (or at
> least some of it), and it is in German (surprise!). I've got no idea how to

> proceed.

Well. you don't need all that, for a start. A _basic_ MiNT setup needs the MiNT programme for your auto folder, MINT.CNF (the configuration text file, an example comes with the binaries) in your root directory of your boot disk and an accessory (TosWin? I can't remember). Once this is all running a shell (cli) is useful to run with TosWin(?).

> Well, I suppose that's enough for starters. No doubt the answers will
> confuse me enough that I have to ask a fresh batch of questions.

There you go, I hope that any mistakes I've made are put right before you read this!

Funny, you should mention this. In general it's the other way round : US
citizens forget that there are other parts of the world. Sometimes they
realise that there is Canada or Mexico, maybe even UK, for most of
them that is all of the rest of the world.

> BTW. I do my own translation of german programs but it sure would be

It's all a question which market is targeted. Germany has always had a
mayor share of the worlds Atari market, and still I think more than half
of all Atari programming is done in Germany. But I agree : At least an
english version of any software should exist.
But consider it the other way round : Would any US based software company
(like Gribnif, for instance) release german versions ??? And there _are_
still people having trouble with english software.

Cheers Peter

3048. ATARI ST for sale

Newsgroup: comp.sys.atari.st
Date: 1996-02-12 00:00:00 UTC
From: Benno Hofschreuder <b.hofschreuder@simed.nl>
Message-ID: <311F3439.2A32@simed.nl>
Source record: 150732

I have for sale a ATARI 520ST+ computer
(HOLLAND)

With:
- 3.5" en 5.25" diskdrives
- harddisk 105MB
- HD and powersupply built in transparent case
- clock built in
- 2.5Mb of memory
- 28Mhz speedup card built in
- hardware 386-DOS card
- B/W and color monitors
- printer
- mous & joysticks
- books (Dutch)
- lots and lots of software (Prof. and games, more than you can
imagine!!!)
everything in good shape, and working properly.

The price I ask is 950 Dutch Guilders for everything.

If you are interested mail me!!!

Full colour support is not a part of Papyrus 3 Gold, but limitted use is possible. What do you want drawing tools for? This would only increase the size of the program, limitting development of other areas. What you need is Kandinsky, it does a lot more than Papyrus could ever do with drawing. The most annoying things about Payrus 3.54 are the use of the right hand mouse button for windows that are not on the top, and the lack of drag-and-drop support.

> still could make refinements after disassembly to make it even better.

Good compiler, but sadly lacking in the integration of editor, compiler, linker, librarian tools. But, as a 1985 compiler, it was quite good.

Megamax released Laser C, of which I received a "scurrilous" copy. I like it, so went to a shop with cash in hand to buy it. Some &*!*^ had walked off with the discs for it. (I got the manual for nowt as they were closng out of Atari stuff). I couldn't find anywhere in the mags selling it, so I bought Lattice C direct from Hisoft instead. [I have destroyed my copy of Laser C]

> Now I'm working on a PC under windows 95 and I can't believe the kind of
> waste in this system. Wasted memory, sloppy coding, excessive repetition
> of routines.......the list goes on.

Scuttlebut says that memory/drive manufacturers give Microsoft a kickback for making Widows slow and bloated, so people need to go out and buy more memory and disc.

In essence its a "my yingyang is bigger than yours". If your software only uses 350k of disc and 128k of RAM, it must be very bad, as product X uses 231 Mbytes of disc and 19.4 Mbytes of RAM.

> I wonder how big the hard drives are going to have to be when these people
> reach the peak of programming laziness.And also how slow the programs are
> going to be. Or maybe we'll make yet another microprocessor to go faster
> so we can waste even more space.

Dont forget, a Microsoft/Intel computer is a "real" computer, and anyone with anything else is obviously using a toy. A computer with less than 8 megs of RAM aint a real computer. And as for hard drives, one gigabyte is for sissies - we use half terabyte drives (which are already feeling a bit cramped), so everyone else has to use the same too.

But then of course, we dont need to replace our computers every eighteen months. A nine year old 1040ST will still do most things anyone wants - but a nine year old PC-AT will not.

> I also can't understand how a company like microsoft can get away with
> making an operating system that takes as much as 2.5 minutes to oad into
> my computer???????????

Coz billions spent on advertising/mind-control has an effect on sheep.

Free thinkers using alternative systems and hardware are thankfully immune to this "Bill Gates Is God" and "Microsoft Can Do No Evil" brainwashing.

And long may that continue...

>
That is not neccessarily due to MINT.CNF. Try this : Rename MINT.CNF to
something else. Reboot. MiNT should be startet, and the desktop should
appear. You should notice MiNT only from existence of drive U:, apart
from this there should be no difference to the MiNTfree system.
Now create an empty MINT.CNF and copy subsequently piece for piece from
your old MINT.CNF into the new one, the INIT= line as the very last one.
This way you should be able to isolate the problematic piece of MINT.CNF.

> Then it set's slip and ppp going.
> Then it say's..
>
It starts sockdev.xdd, and loads the *.xif drivers.

> *starting network daemons [: no such file or directory* (twice)
>
You've obviously some sort of shell script running. Without running a
shell via INIT= in MINT.CNF this should not occur. I prefer anyway to
start the daemons directly from MINT.CNF.

> Then now nohogs installed it hits the desktop. Opening windows etc
> is fine, but it crashes as soon as I click on a file. A string of
> messages come up that change each time PC= textbase= etc etc.
> It usually gives the code _2560_ or _2816_ when leaving mint...
>
Conclusion : Try to use a version of MINT.CNF without the INIT= line.
You should have MiNT as well as MiNTnet bootet, but not the daemons. This
should work. Then start the daemons from MINT.CNF using the exec command.

> I may well have missed something vital when installing, I followed
> the mintnet faq but don't have a clue really... I haven't the space

As I said earlier, a minimal MiNTnet setup uses less than 1meg.

How much mem is available in the computers ? Why do you want one of the
computers as a server ? Does it have a particularly large harddisk ?

An easy solution might be connecting all STs to a ring via MIDI cables
and running MIDICOM.
A more sophisticated solution would be a MiNT/MiNTnet based net that
ideally could be hooked up directly to internet.

OK, bad example, 'cos it can be seen the other way round. What I meant
was the client asks the server to perform some calculation on data.
It leads to the question : What sort of service can software on a central
host provide, apart from computing power ?
But I have a very good excuse : I didn't choose the example ;-)

Sorry to hear about it, you got cleaned bigtime! For $160, you
should have been able to locate a GOOD used ST, and kept the old one for
parts. (you could sell a power supply to the fellow a few articles back,
who needs one badly!)

Former Atari hardware victim,

Now a DOS victim; ever upgrading, comparing cold specs, never
getting to use the stuff for fun or function.

>
>The URL is in English! When you follow a link you land in the right
>subdirectory for Atari.
>
>Maybe there is a list like this already existing. If so would you please
>contact me.

Competition eh? ;-)
Yes, actually there is one, which I started making. I used to update it from time to time and upload it frequently to the Atari ST newsgroups. That was back in the days when I had free/unlimited net-access (university).
Then I went on to have a commercial dial-in type account and as keeping a list like this updated takes a lot of time (and money when you pay for the online time)- to check if the sites are still working and have Atari directories etc. I had to get help, so Mark Smith in the UK offered to help me out.

Now, I haven't heard from him for a long time and haven't received any replies from my emails either. But I don't have any plans to 'scrap' the FTP list either...
So, Mark Smith- if you're out there, please get back to me as soon as possible. I know there are some new sites out there, and I guess some of the old sites have had some re-organizing etc. so I'm long over due :-(

The latest list I have is from July 1995 I believe, and if someone wants to download it they can find it in my web page (atari section- it's easy to find!)

http://www.sn.no/~hallvart/

or at my FTP site:

ftp.sn.no /user/hallvart/atari/atari_ftplist.txt

As soon as I get hold of Mark Smith I'll try to get a new one out, if not I'll do it myself...

So, if there is anything I should know regarding updates/deletions/new sites etc. please let me know! thanks

You double click it!!!!!! Just try it. It might be a ready to run
program, or it could be a self-extracting file which as the name says,
is a file that de-compresses itself without the use of any additional
software.

I also found out that if you have TOS 2.xx and up you can simply put the 'st2unix.ttp' and 'unix2st.ttp' programs on the desktop and drag text files to them, and they'll be converted without the need of any command line input or putting the files in the same directories etc!

I tried it today with TOS 2.06- now why didn't I think of that before!! ;-)

STE with TOS 2.06 (which should have the serial thing fixed).
Yes, I'm using Hsmodem (though it's a real pain- it always needs a
cold-reboot, or else I get bombs when starting up!).

The problem only occurs after having used Notator (MIDI sequencer)
since it allows for more than 16 MIDI channels by utilizing the RS232
port and an expansion device. So every time I start/stop a sequence I
can see the modem's LEDs flash. There must be a way to 'clear' this
instead of rebooting the machine.

ab078@sfn.saskatoon.sk.ca (Travis Kern) wrote:

> Can the Snappy image grabber be used on any Atari computers? If not, is
> there something similar for the Atari platform?

I don't know what the Snappy image grabber is, but if you need a snapshot
utility which produces IMG files on any Atari computer and in any graphics
resolution (including Hi-/True-Color graphics cards), you should download
the brand new SNAPPER, available from

ftp://ftp.cs.tu-berlin.de/pub/atari/Graphic/snapper.zip
or
ftp://ftp.uni-paderborn.de/pub/atari/tools/gemutil/snapper.zip

It works as ACC or APP and has some useful options, though the documentation
is only in German (but should be useful anyway).

Hi,

Rod McCall (rmccall@mcs.dundee.ac.uk) wrote:

: What about Thats Write? Is it any good for DTP stuff?

I don`t think That`s Write is flexible enough to do real DTP. It is really good for writing diploma works or PhDs for you can have chapters automatically numerated and have a listing of contents which I didn`t find in Papyrus (I have only seen a demo version of Papyrus 4).
Integrating tables is a little more complicated than in Papyrus and you will miss a possibility of "floating" text around a picture (Is this the correct English verb for it?).
You can position a pic in between text with no text on right and left sides of the pic or you can write over the picture (with the picture as background).

You can print up to 5 columns per page with That`s Write.
This soft is a powerful tool for heavy writers and printing results are excellent although it uses its own drivers and GDOS only for the tables. But it is not that simple to cope with as Papyrus (perhaps due to its complexity?).

It's a very bad idea. On the other hand posting these to
comp.binaries.atari.st might be a good idea.

--
Because that is what the binaries news group is for. Some people have to
pay to download newsgroups and binaries increases the amount they will
have to pay. Normally if you tell people where people can get files from
- which site and whereabouts on it, then people who want the program can
get it.

>a multiple of 8 however, they recommend a multiple of 4) Those are my settings
>and things are a lot more stable. I use to have hangups a lot and now I dont.

I tried these settings earlier and didn't have a crash for
a good five minutes...previously I'd been using the defaults
and got a crash almost every other site..

I've found that I get a lot of crashes at the end of a large page..
When it's loaded from file later, the page seems intact...
Any ideas?

Cheers,
Smn...

: do with a TOS file. I know that I can download it using the lynx D
: command, but then what do I do? How do I make it a working file? thanks
: in advance.

TOS is an executable program. Just run it. (The Atari uses several
extensions for executables: PRG (typically, a program which uses GEM),
TOS (a program which does not use GEM), APP (GEM program which can be
installed as an application) and TTP (TOS-Takes Parameters, which lets
you enter a command line into the program). Alternate desktops also have
a few of their own executable extensions (GTP - GEM Takes Parameters, for
example) and allow you to define your own. There are also a few
pseudo-executabe extensions -- most commonly, SEA, which stands for
Self-Extracting Archive. These programs need to be renamed to TOS or
PRG before they can be executed.

3075. Falcon IDE Upgrade

Newsgroup: comp.sys.atari.st
Date: 1996-02-12 00:00:00 UTC
From: needhadp@eng.derby.ac.uk
Message-ID: <311F0FE4.ECE@eng.derby.ac.uk>
Source record: 150795
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I currantly have a Falcon 4MB/65MBHD with a nearly full hard disk as such I have made inquires about upgrades.

I have been offered a 1.2GB IDE disk, probably 3.5", what I need to know is this.

1, Can I connect it in parallel with my exsisting drive?
2, If so how?
3, If not can I simply replace the old one with the new one, I am aware that a 3.5" is larger than a 2.5", though I would have no problem with a cable comming out of somewhere connecting to a box on a shelf.
4, Can the Falcons power pack handle a 3.5" drive unit?
5, What is the largest partition size that AHDI can handle? (6.04)

If possible could you E-Mail me a copy of your reply since I don't have Web access all that often, but I can get at my mail.

needhadp@eng.derby.ac.uk

You can get a clock cart with a through-port... which means that you can plug
your Cubase dongle into the other end.

Some people say that the through-port clock carts are unstable... and IIRC
one company has stopped making them for that reason.

3084. Network ST (NeST) the biggest Atari Network Going!

Newsgroup: comp.sys.atari.st
Date: 1996-02-13 00:00:00 UTC
From: dbrewood@nest.demon.co.uk
Message-ID: <6680dbrewood@nest.demon.co.uk>
Source record: 150604

```
Network ST International Association (NeST).
============================================

Press Release Issue 012 (24/09/95)

What is NeST?

NeST (Network ST) is an international network based on FidoNet technology,
dedicated to the Atari range of computers, in particular the Atari ST, TT
and Falcon. The aim of the network is to provide messaging facilities to
all Atari users the world over who are interested in the world of
communications and in the ST. Eventually it is planned that NeST will
extend to virtually every country in the world, however NeST now links the
following countries:

United Kingdom
Canada
The United States
Germany
The Netherlands
Australasia
Italy
France
Spain
Sweden
Czech Republic
Poland
Norway
Denmark
Luxembourg
South East Asia
Belgium

This is by far the largest Atari dedicated network in the world, and it is
growing rapidly, with an average of a new country coming online every
couple of months.

NeST members work closely together to generate a good atmosphere; within
NeST you will not find any political battles, something which can't be
said for a lot of other alternets. NeST also has a habit of collecting
programers from every walk of life, including some very well known names,
who are either members of the network itself, or affiliated with it.

NeST has a wealth of message and file echos, ninety percent of which
are
```

echo'd round the world, and replies can be achieved within three to four

days. The message echo's cover a terrific range, running from software

support (LED, JEKYLL, JetMail, MakeDiff, Semper, etc), programing (GFA, C,

assembler etc), and general interest echo's like the common room where chaos

rules, and users let off steam, and the Q&A echo where weird and wonderful

queries are posted. We also have direct contact with the Atari publishing

world and have contact echo's for both ST Format and Atari World magazines,

with many members of the editorial staff online.

Or if you are looking for something a little different why not take an interest in Space Empire Elite? The game runs throughout the network, using special programs coded by NeST members to coordinate and send inter-BBS attacks through the network.

NeST allows the use of almost any mailing software, be it F-Net/Crossnet, or fidonet technology, to be used to collect mail, giving a very flexible system of mailing. Point systems are given rights too, if they take a 'Pvt' address in the master NeSTList, they are allowed full participation in the network, including taking part in votes on major changes within the network,again this is rarely allowed in other networks.

One item that worries some users, and sysops is cost, that is network fees for linking into the network itself. With NeST no such fees exist, as each member works freely to gain the best connections, minimising mail costs as much as possible.

NeST may be accessed via the following methods:
- Dial up (log on) access via a NeST BBS and a comms terminal.
- Via .QWK packet reader at your local NeST BBS.
- Via fidonet point or node access software, again via your local NeST BBS.

It should be noted at this time that NeST can not currently be accessed via

the Internet.

NeST also has available all the files taken from the FAN (Final Atari

Network) file echoes. FAN is often the first place to find new files, many

times directly from the authors themselves and has links to the
respected

MausNet network in Germany.

NeST users also have the ability to access InterNet email and newsgroups
via

the NeST Internet gateway located at
90:100/106.0@nest.ftn

(@nest.demon.co.uk).

If you want to join a network that's friendly, fun, well informed, and
concious of what's going on, well why not try NeST, I don't think you'll
regret it!

For more information contact:

Daron Brewood - 90:90/0.0@nest.ftn
- dbrewood@nest.demon.co.uk
- dbrewood@cix.compulink.co.uk

I look forward to hearing from you...

Daron Brewood - NeST Coordinator

As far as I know, SoftPC cannot read the Atari harddisks. However, you
can create PC hardisk files, which contain all the files the PC can
access. IIRC you go to the configure menu, and say that you want to
create a new .HDF file (a PC partition).

I cannot remember precise details though... (but can maybe check)

Even off Hard Disk, SoftPC is rather painful... (although maybe better
on an accellerated Falcon...)

jklimch@curly.cc.emory.edu J David Klimchak at Emory
University

Hi, I'm new to the net & am confused about FTP procedures (on an STE with stalker). I understand downloading ZIP, ZOO, LZH etc. files but what do I do with a TOS file. I know that I can download it using the lynx D command, but then what do I do? How do I make it a working file? thanks in advance.

thanks to all who responded to this post. I tried renaming the file extender.HTM to .TOS and double clicked. The response was "not a recognized program file" or something to that effect. I also tried renaming the file extender to ZOO, ZIP, LZH and ARC but the files are not of these types either. I originally downloaded these files from a german ftp site which listed them as TOS files. So any ideas about what I should do next?

>with my Mega-4 and ISAC card, and once again it did not function! Warp
>9 works in all cases (too bad it is so much slower!). What is going on
>here? I was under the impression the NVDI worked with such screen
>expanders... Could the problem lie with Geneva? (Seems unlikely, it
>works with everything else I have...)

Here's my 2 pence worth. I just got the bigscrn utility for my ST
which I wanted to run on my colour monitor. NVDI locked up my machine
when I tried to use 640x400 16 colour mode - the emulation worked fine
when I removed it.

So does NVDI just want configuring or is it broken?

>
>He has a few of the zip files of the package, but there doesn't seem
>to be any NOS documentation in any of them. He has the Oasis docs,
>but they don't tell him how to do anything on the NOS side of things!

The Nos docs are way out of date and not a great deal of help as they
normally assume PC usage - you have to wade through a lot of garbage
to pick out the useful information.

>If someone could point me to a location for the NOS docs, that would
>be great.

ftp.demon.co.uk and look for documentation to do with Nos then Ka9q
which is the PC name for it.

>Or if someone could quickly sum up the procedure for getting Oasis and
>NOS to get mail & news once logged on, that would be VERY helpful! He
>has the dial script and everything setup up already, but once he gets
>logged on, he doesn't know what to do next!

Oasis has absolutely nothing to do with anything that happens whilst
connected - it's job is "simply?" to ensure all the files Nos requires
are in the correct place for Nos to find them then to make use of the
files after Nos has written new ones. The original offline reader is
Snews (or PC DIS?) which is entirely text based - Oasis replaces this.
In fact Nos can be run directly as I do.

In Nos, assuming his provider supports NNTP and SMTP for news and
emails respectively:

type "so" (for socket) - if there's a line that lists "smtp_listen"
then he will automatically receive emails when they arrive. If it's
not there then it is not configured properly.

To check if emails are waiting to be received he may be able to
"finger" but the exact details will have to be given from the provider
(my provider allows finger swampdog@post).

Emails are posted by "smtp kick" (sm k for short).

News is both posted and received by "nntp kick" (nn k).

If he's not getting any visual feedback try upping the trace levels of each (ie smtp trace <number> and nntp trace <number>) where the higher the number the more info you get. Try

"nntp trace 3"
"nntp verbose on"

He may get a "501 USAGE" error when posting news articles. There is a bug in Nos - if his provider has rigidly implemented the RFC for news then the article will still go but it could easily be rejected. This will be obvious because another error code and message will be shown. There is a fixed version but I don't know where it is. Don't worry about it atm. He should be using Nos 0.42 at least.

Email me if he wants a working startup.nos to compare with his.

>Has anyone had a problem with CAB downloading pictures corrupted,

No.

>or not printing the entire picture on screen.

Yes.

>If so, have you fixed it? If so, how?

This happens because of timeouts - try hitting "reload" it invariably
works the second or third time.

>I'm trying to get ready for a demonstration, and it would be good
>to get the entire pictures on the screen. Thank you for any help you can
>render.

I'd cheat like they do on telly, nobody's gonna be too impressed with
it if it takes ten minutes to load a single page even if you do tell
them it's not the browser's fault.

Make sure you've already downloaded them so they only have to come off
the disk! If you must have something in "real time" make sure it's
a fast site that you've tested.

>just a matter or ripping out the internal speaker and replacing the hard
>drive, or is it more complicated?

It's not complicated. All you have to do is to get an adapter-cable for the
small 2,5" internal IDE-cable in the Falcon to fit a 3,5" IDE drive. That's
about it.

There is a program about called 'whatis' which will try and identify
a file, and will tell you what it is. I got it from an ST Format coverdisk,
but I guess it is available via FTP from somewhere...

Have you tried displaying the file? It might contain some header info
that might help you to identify it. (eg. LZH files have -lha5- at the top.)

What is the file called, and where did you get it from - someone might
already have been through this...

I hope this is of some help...

AS> You can get a clock cart with a through-port... which means
AS> that you can plug your Cubase dongle into the other end.

It is also possible to buy a clock chip (from Radio Shack in the US)
called the 'Smart Watch' module, and put it inside a 1040ST. I don't
know about a 520. Installs under any one of the TOS chips, and
sometimes takes some hacking. Software (freeware) would be Bill
Penner's A Real Time Clock v3.5 (AReaL35.xxx, maybe). Installation
instructions are in that archive, too.

Karl,

You probably need the ET-4000 version of NVDI to work with your Nova board. You might be able to do an upgrade/trade-in of NVDI 3.02.

Phoner <phoner@zodiac19.mimuw.edu.pl> spake thusly:

P > you're wrong. officially there's no ide controller for st's,
P > but my friends makes one.

Yeah, I know. That'll teach me to make absolute statements. In my defense, it is true that such controllers are not commercially available in the US. So the answer to a US newbie or not-so-newbie should be what I said. But several people have corrected my earlier statement. Such controllers are available in Europe and Scandinavia.

I passed the data along to Dave Troy at Toad. His response was that he knew about it, but had no real reason to import it; according to him, scsi drives are the same price as ide drives in the US.

JH> not likely to be able to check here again soon.

What hardware do you have available? If you do not have access to an Atari ST, I can't help you. If you do, find a copy of Marcel2.3. It will import First Word files, and export as RTF (Word Perfect 6, MS Word). If ascii is all that is necessary (text formatting like italics and bold need not be preserved), First Word will export directly ('edit mode'). Make sure you export the files to disks that have been formatted on the Mac, in whatever is used to make pc compatible disks. Second choice: format them on the pc in question. The ST won't have any trouble reading and writing to such disks; but the reverse is not always true.

Not to defend the problems with Windows, but this sounds exactly like the kind of nonsense that anti-PC, anti-Microsoft cronies would make up. Microsoft is so profitable that they do whatever they want and don't need to accept "kickbacks." How many RAM and HD manufacturers are there? How could they possibly organize in such a manner? Just the negotiations for such operations would be an incredible undertaking, not to mention of questionable legality.

Despite what I have just said, I have to agree with this point.

> But then of course, we dont need to replace our computers every eighteen
> months. A nine year old 1040ST will still do most things anyone wants -
> but a nine year old PC-AT will not.

I disagree. What won't a 9 yeear-old PC do? Will it not do for programming, communications, word processing, read CD-ROMs? So it won't play the latest games.... I'm not saying that a 1040ST won't work , either.

Yes it is noticably slow, but for what I need it isn't too bad. It dawned
on me would it not be possible to enhance it by utilising the DSP and
optionally the FPU?

Also at present it only seems to run in CGA, perhaps by using the above
it would be possible to get VGA and a higher speed.

3114. Atari to merge with JTS

Newsgroup: comp.sys.atari.st
Date: 1996-02-13 00:00:00 UTC
From: Walter Hellman <hellman@teleport.com>
Message-ID: <Pine.SUN.3.91.960213173927.23115A-100000@kelly.teleport.com>
Source record: 150634

A story was posted in Reuters today reporting that Atari Corp.
has merged with a disk drive maker, JTS:

Reuters New Media

Tuesday February 13 6:02 PM EST

Atari To Merge With Disk Drive Maker JTS Corp

SUNNYVALE, Calif. (Reuter) - Atari, the multimedia games company, said
Tuesday it agreed to merge with JTS Corp, a privately-held maker of
disk drives, and will take on the JTS name.

Atari, maker of the popular video game Jaguar and other titles
playable on Atari's dedicated platform, has met with stiff competition
from other games makers such as Sega as well as from personal
computers.

An Atari spokesman said that the company was looking for a strategic
investment.

``We had $50 million in the bank,'' said spokesman August Liguori,
from Atari headquarters in Sunnyvale, Calif.

He said that in the past, Atari had sold computers, printers and other
computer components. ``To some extent we are going back into the
computer business'' by merging with JTS.

The new entity will be known as JTS Corp, but Atari will still exist
as a brand name.

The Atari entertainment business and the JTS disk drive business will
operate as separate divisions of the new merged company.

>added on what seems to be most UNIX text.

Yes, the best tool to do that is BLINEX, a part of the IDEALIST
package (exactly of the IDEATOOL.ZIP archive). It can convert PC/Atari,
Mac and Unix text files.

It can also remove blank lines from a text, leaving only single blank
lines, or double, or triple... It can also convert the charset from
PC/atari, Mac, MS-Windows, ISO 7bits, and ISO-Latin-1. And also remove
trailing spaces or end-of-line tabs.

Really usefull and fast, I found it (version 1.6) at ftp.cnam.fr.

>>and anonymous/email address in the 'open' box, and it always came back saying
>>the server did not ask for a password. I use demon.co.uk domain, and
>>ftp.demon.co.uk diid the same thing... :-(
>>
>>What am I doing wrong?
>
>I wish I knew

I tried ftp.demon.co.uk last night and it worked fine for me. I put
the servers name in then in the open box I typed anonymous and
nick@flinny.demon.co.uk and it went away and cmae back a few seconds
later with the root directory list

>Personally I'd like to be able to load and configure before activating
>STiK. Presumeably this is possible by enabling but not dialling, but
>surely the ability to load and have a look around before doing anything
>specific would be useful.

If stik isn't enabled then the program cant hook into stik would you
rather it let you load the program then you dial out and try to
connect with the ftp program only to be told that you cant because the
link with stik hasn't been initialised? maybe there is a way around
this maybe initialising stik only when you open a connection and
breaking this link once you close a connection but i dont know im not
a programmer.

>I hope I don't sound too negative here. I'm full of admiration for anyone
>writing software for any computer, particularly TOS-based computers. And
>I'm most pleased to see a number of people adopting STiK as some kind of a
>standard and writing applications for it. I hope others with similar
>skills will be inspired to have a crack at this as well, and will be
>generous enough to share the results with the world in general. Good luck
>and keep up the good work. Hope constructive criticism is of help.

Im sure the Author will welcome and constructive criticism he gets and
will hopefully keep improving and developing this program it has a few
faults but since when has the first release of a program been perfect?
:-)

>Right....now I'm off to reboot and have another crack.....

Did you get it to connect? the first time I tried it it crashed on
every site I tried but when I ran it again last night it worked on all

sites I tried but one (src.doc.ic.ac.uk).

: Angus Armstrong

AW is pretty limited in the formats it can read, but if the file
is comma-delimited fields, it can do that one. Can LDW write out
in that format? It's been too long since I used Power to remember...

: SLM804. The only one which I know of is an old Megafile type drive since this
: has a DMA through port. However I'd rather use a newer device if I could. Are
: there any ways to use a Link2 for example without throwing away my SLM804.

The slm804c controller has a dma passthrough. If it's an external
harddrive, it should just connect to this little box. That was my
setup for a while. It's annoying, since the laser has to be
turned on or your harddrive gets corrupted, but you can turn it
on and leave the back open and that will work alright.

3130. Spectre GCR Mac emulator, w/ Mac Rom, interested?

Newsgroup: comp.sys.atari.st
Date: 1996-02-13 00:00:00 UTC
From: positivechurch@enter.net
Message-ID: <4fou3s$1r9@news.enter.net>
Source record: 150696

Hi. I was an Atari user from 1984 to 1993. Went from 8 to 16 to 1040 with hard drive before bailing out. I know nobody wants to hear it, but for publishing, writing, internet, etc., I'm much happier in Windows these days. Software's immediately available, cheap. Hardware is available everywhere. But I'm off topic.

The Spectre GCR. I bought it in 1992 in a last-ditch attempt to extend my Atari experience by expanding my machine's capabilities, i.e., turning it into a Mac at times. I paid $500 for the Spectre and necessary Mac ROM. Then found out I was not Mac literate enough to figure out how to really make the most of it. I probably gave it 40 frustrated hours before packing it all away in its box. Where it stays. Anyone interested? I'd be happy to sell it for a great price to someone who will use it! I even have some Mac software, (but it's old and you'd probably want to scavenge some newer stuff). The claim was that the Atari would run Mac faster than Mac when you used the Spectre. I can't vouch for that.

My address is positivechurch@enter.net

You can reach me by phone, days, eastern time, at (610) 967-8310. I have voice mail on the line in case I'm out or talking with someone...

Regards,
K. Winston Caine

>I am proposing a newsgroup for buying/selling Atari hardware and software.
>I have posted this proposal to alt.config for any recommendations.
>If you are interested having this new group, please let me know.

With the rather large amount of FS postings in c.s.a.s. my download time is pretty long. At the moment I am not really interested in buying any ST stuff. A separate group for people buying and selling Atari stuff would be good IMHO. Then, if and when I want to buy, I can add the group to my active list. Another suggestion, how about everyone putting their country (US, UK etc) in their subject line, if they are only interested in selling to people within their own domain? I know a lot do, but perhaps it might benefit everyone if it became custom? Just a thought

>> major languages of the world ie : English

--
That's my point ! Maybe some of these programmers should take a lesson
from Alexander Clauss and provide the user with major language
resources . Apex Media is a professional program and they did exactly
that . The list can go on for a while of quality programs that provide
alternative language resources . It's also a way for people to find
out about software coming from other countries .
As an example I have at least 9 German CD's all for Atari . There was
quality programs that I had no idea were even there for months unless
you want to go through Gigabyte after Gigabyte of software to find
them . I'm a pretty stuborn guy and I did that a lot but it would of
saved me a lot of aggrevation . So to the programmers out there take
into account the Major languages we in the Atari world operate in .

From: Trevor Cordes <Trevor_Cordes@umanitoba.ca>
Message-ID: <31202984.794B@umanitoba.ca>
Source record: 150700

A friend of mine is trying to get the AtariNOS/Oasis package working for the members of our local user group.

He has a few of the zip files of the package, but there doesn't seem to be any NOS documentation in any of them. He has the Oasis docs, but they don't tell him how to do anything on the NOS side of things!

If someone could point me to a location for the NOS docs, that would be great.

Or if someone could quickly sum up the procedure for getting Oasis and NOS to get mail & news once logged on, that would be VERY helpful! He has the dial script and everything setup up already, but once he gets logged on, he doesn't know what to do next!

Thanks!

Message-ID: <1996Feb14.103924.1549@dcs.warwick.ac.uk>
Source record: 150506

What are the best shareware/freeware games on the ST? I used to own a 520 in the 80's and have since got hold of StonX, and would like to get some games, but I don't know which are any good.

I have found Megaroids, but there were lots of games on ST Format coverdisks that I would like to see again, especially a game a bit like space war, but with submarines where you had to surface for air and collect missiles from your base on the sea bed.

What are your favourite PD games?

Date: 1996-02-14 00:00:00 UTC
From: mbge4mdc@meehpb01.ee.man.ac.uk
Message-ID: <4fsd4m$chv@yama.mcc.ac.uk>
Source record: 150509

Personally I think it would _have_ to have the OS on ROM - ideal for a quick bootup or those times when sods law strikes your hard drive. However, I'd also like to see "EEP" added to the front of that - all the advantages of ROM, but as upgradeable as disk based.

In fact, ideally it would have three or four OS EEPROM slots, switchable (either hardware, or better still, via software at bootup). Just imagine being able to select TOS5, MultiTOS(5), MagiC or Linux - all from ROM. Bliss.

While we're at it, in fact, why not a rewrite of TOS for CHRP (or PPCP or whatever they're calling it these days!). Pick your own hardware manufacturer, and then choose the nicest OS (with the option to run AIX, MacOS or whatever else if you want to).

Cheers,

Xav

>In work I'm using a Trust 2400 dpi flatbed, it only costs ï¿½299+VAT and
>does a superb job.
In germany there are Trust-scanners available that are full compatible to the
Mustek CX scanners. We have a driversoftware for the Mustek CX scanners. It
works on SCSI-TT, SCSI-Falcon and ACSI with hostadapter link(from ICD or H&S).
There is a demoversion in our BBS (Germany 09445/953149).

The Falcon 030 does have a bi-directional printer port.
I hope that someone get SNAPPY to work with the Falcon computers.

Raymond

PS One more good reason to get a Falcon 030 :-)))))

3147. Atari Compendium CD!

Newsgroup: comp.sys.atari.st
Date: 1996-02-14 00:00:00 UTC
From: jesper.kock@kockens.ct.se
Message-ID: <ftn_2.200.423_31224dea_Jesper.Kock@kockens.ct.se>
Source record: 150513

```
Atari Compendium CD Is Now Available
------------------------------------

What's On It?

- "The Atari Compendium" in HTML and Adobe Acrobat PDF Formats, plus:

- Complete Web Browser Package - NetBSD OS files
- Jaguar Game AVI Demos - Linux 68/K OS files
- MiNT Multitasking OS - Programming Languages
- Editors - ST, STe, TT, and Falcon Demos
- MagiCMac Demo - Most of the UMICH Atari Archive
- GhostScript 3.33 - Commercial Software Demos
- Portfolio Files - Atari's Tempest 2000 (PC) Demo

The Atari Compendium is the complete guide to programming the Atari
ST. The rest of the disc is filled with PD software, shareware, demos, and
pictures! Possibly the FULLEST ST CD-ROM available! Contains 649MB in 7000+
files! This is the only Atari CD that contains the WWWxxx.ZIP web browser
package (requires SLIP Internet connection).

The CD comes with full four-color packaging in a standard, poly-wrapped
jewel case. We believe that professional products deserve professional
packaging, and the Compendium CD looks as good as it is!!

DHB> replacing my HD driver itself. Anyone been able to do this?

Hello David,
I use SCSI-tools/HuSHI and when partitioning HD's you can set a PC-compatible scheme, but maximum partition size is 32MB, so if would mean partitioning the Zip-disk into 3 or maybe even 4 partitions, but it should be possible. I will try it as soon as I have some time left... Maybe someone else in the group has tested already?
I've also heard of a program called BigDOS, which should be able to use PC-formatted harddisks of up to 2GB, but I'm not sure I've understood correctly - has anyone tested BigDOS?

Best regards,

Claes

MF> audio quality for me? I would appreciate any input you can
MF> give me.

Hi Mark,
I've already answered this in Cubase-users group, but I believe it can be of great interest in this group too, so here we go again:

When I bought my Falcon system there was only one alternative and that was the FA-8, so that's what I'm running. If I decided today there wouldn't be any doubt at all - I'd buy the JAM-8 instead. I've tested it in my setup and it sounds absolutely great! The balanced output is definitely a good thing - it connects to any professional mixer with balanced inputs, giving you even better sound quality because of the higher levels in the cables. If you use it with an unbalanced input, the sound is still absolutely perfect. The minute I find a buyer for my FA-8, I'll get a JAM-8 instead -go for it without a doubt!

Here is some data:
Frequency response 10Hz-22kHz +-0.1dB
Dynamic range 93dB A-weighed
Signal to noise 89dB
Harmonic distortion 0.005%
Output unbalanced 1.4V RMS
Output balanced 2.8V RMS
Size 129*47*134 mm

Current price here in Sweden is SKR3290 (which is about USD470 if I remember the exchange rates correctly).

Best regards,

Claes

I just bought a copy of Imagecopy 4.0 CD, and it's wonderful!

I only have a couple of gripes, and they're pretty minor:

1.) When viewing JPEG files, if the file isn't complete, the program pops up an error box saying it cannot display the file; however, the way a JPG file is written, it could (and should!) display what it had. Studio Photo allows this, but it's such a pain in the ass.

2.) When you resize a slideshow window, it should use this as the default size for additional slideshows.

Other than that, this is a great program! If you need to view, organize, catalog, or print grahic files, get this program.

Source record: 150519

DOW JONES NEWS 02-13-96 10:09 AM
Sunnyvale, Calif. (Dow Jones) -- Atari Corp. (ATC) and JTS Corp.
agreed to merge.
August Liguori, chief financial officer of Atari, said the
transaction is a stock swap for about 40 million Atari common shares,
valued at about $80 million.
Liguori said Atari will continue to support its Jaguar video-game
system through 1996, despite heavy competition from Sony Corp.'s (SNE)
Playstation and Sega Enterprises Ltd.'s Saturn systems.
JTS Corp., of San Jose, Calif., is a privately held maker of
computer disk drives.
Atari said in a press release that under the agreement the merged
company will operate under the name of JTS Corp. and the current
officers of JTS Corp. will become the officers of the merged company.
The Atari entertainment business and the JTS disk drive business will
operate as separate divisions of the merged company.
The boards of Atari and JTS approved a definitive agreement for the
merger. Closing, set for the end of the second calendar quarter, is
subject to some shareholder and regulatory approvals and other
conditions.
After the merger, Atari shareholders will own about 60% of the
outstanding shares of the new company. The transaction is structured as
a tax-free reorganization and will be accounted for as a purchase.
Atari also said it extended a $25 million bridge loan to JTS Corp.
and if the merger is not consummated, the loan will be convertible into
JTS series A preferred shares at the option of Atari or JTS and subject
to some conditions.

Apparently, as long as you keep partition sizes under 32 meg you
should be OK. I accidently used a PC formatted Zip on my St and all
data except some emply folders was lost, this was however an
un-partitioned one but it might be worth a try. HDDriver does contain
an extra program that should be able to read DOS Hard disks, it is a
bit faster than ICD which I used for 3 years, it's probably orth the
extra cash to get HDdriver as it also supports zip commands for write
and password protect.

Many thanks for the replies on this. At least I now feel confident that the fading screen business when there's little white information is probably not a fault, but just the (rather odd) nature of the beast.

And while it's gratifying to discover that I'm not alone with the wobbly width syndrome, I've yet to hear from anyone who knows anything about it.

Hm, oh well, looks like a letter to Atari World is due!

If I ever fix it, I'll remember to leave the raster size alone!

Mine *is* a Brit standard 50 Hz job, but I'm sure that that's a red herring, as the monitor (unusually) uses a standard mains transformer bridge rectifier power supply, instead of the more usual switch mode thingy, and there's no perceivable change in brightness or height when the width / linearity wobble occurs. Thanks for the suggestion though!

Never played Megaroids, but I can imagine! :)

I don't think it's anything to do with the tube coating. More likely
some sort of AC coupling I'd imagine, that loses track of where
black's supposed to be, unless of course Atari deliberately built in
a screen saver! At least I now know *that* part of my problem is just
the nature of the beast!

Ta!

GH> Exactly the same here - it might go on to flickering the whole picture
GH> from side to side very slightly - just enough to leave you wondering
GH> why you've got a headache until it gets bad enough to notice.

Ouch! I think this might be a different fault to mine, as mine is
pretty randon the way it happens. Do you also get a hum bar that goes
up and down the screen rapidly? (power supply filter problem) or it
could be the frame oscillations getting into the line stages
somewhere, or a line sync fault. Or it *could* just be the line hold
preset is wildly out of alignment.

About the fading:

GH> Mine has done this since new. I sent it back under guarantee but it
GH> came back exactly the same. I never got round to taking it further but
GH> it has always been so bad that if there is just a single white
GH> character on the screen you can only just see it, then the screen
GH> fills and I'm blinded.

The fact that you've had it sent back for repair might mean it's
worth checking that line hold preset?

I've had enough replies to this aspect now to believe that they're
all like this! (The fading I mean)

GH> Sorry, it's not the answers you want :-(

Sigh. :(Thanks anyway!

Where can I get this program?
Can anyone email to the author asking if it is possible to read both MSDOS and
Atari format harddisk?
Please reply by email.

Hi: As I recall reading in my Falcon's mannual the printer port supports
bi-directional communication. I just cheched on that to make sure, and
it is bi-directional(page D-2 Falcon). So, may be we could use snapy. I
talked to David Troy about it, and he told me that he would look in to it.
May be we all should write and request some action on this.
Expose works great and at the moment it is being adjusted for
better NTSC capture. Raymond

Antic did a database called BASE2 which could convert or import
DBMASTER ONE databases. It was a very similar and friendly, but a
more powerful database.
Unfortunately, it wasn't all powerful, still had poor export
capability, and is incompatible with TOS 2.05 and above (malloc(0)).

I found it fairly easy to export from BASE2 to TWIST by (I think)
printing a report to disk - I guess a similar thing can be done with
DB Master One.

Nope. The PC's paralell port is different from the Atari's port, in that the PC spec has a "diagnostic" mode that can read the paralell port. It's not supposed to be used, but it's been reliable enough to use to support SCSI transfers.

The Atari printer port is an output-only port, and can't be read.

There are two video image-capture systems that I know of for the Falcon: Videomaster and Expose.

I have the Videomaster, and it has worked okay, but is not by any means the end-all in frame grabbers. It does come with some interesting stop-frame animation software, though.

Expose is more expensive, but it has more features, too, like direct color capture from a composite video signal in. I don't have it, but I'd be interested in hearing from someone who does.

A TOS file is most likely to be "self extracting". This means that you simply put it when you have space and double click on it. It will unarchive itself.

> all partitions other than the first! I had to use the ICDFMT

CBHD was specially designed to understand the same partition table format
as the ICD driver, so something in the installation process must have
gone awfully wrong there.

> Forget how I did the install now. I think I ran the prg in the package
> which had a rsc file. There was a menu entry which offerred "Install" and I

You probably used the configuration application which comes with CBHD 4.5x.
This one had a bug in all but the latest versions which could lead to
overwriting partition table info. Get V4.55, and it should work just
fine.

> Maybe you should also note that Claus Brod occaisionally reads this news
> group.

grin And now I'm coming to get Karl!

While SED is not exactly freeware, it isn't commercial either. I have
posted the source code to the German Mausnet, with the intention that
people add their fixes and enhancements. I didn't post the executable
program because I thought that SED should not be in the hands of
non-programmers.

If Karl or anyone else manages to get a copy of SED and uses it, *I* won't
sue him. If someone tries to sell it commercially or otherwise tries to
make money from it, I will definitely start legal action, not to mention
Maxon, the publisher of our book. Also, if you are using SED, but haven't
bought the book, you cannot count on me giving any kind of support.

But other than that, go ahead and try SED. It's still pretty useful
for a lot of purposes, even though it's kind of outdated in some respects.

>Is there a program which could help me ?
>I'm afraid, I have to save the text as ASCII and format it to TeX
>myself...

If you don't have any experience with TeX, this can be a bit of a pain. But anyone who does can probably type the formulas in TeX just by looking at a printed version of your text. As I don't know of any such conversion program, you may have to start looking friendly to some colleagues of yours. :-)

If all else fails, you could send some sort of uuencoded graphic file (can you export to PS or something from Signum?) of the formulas to me, and being the fanatic TeX-advocate that I am, I would probably do it for you. No, serious.

(BTW, plain TeX or LaTeX?)

Having just aquired a 7 year old PC for nothing, I can probably understand what Gaven means.

The 7 year old PC is so poor when compared to my STFM (it has no colour,lousy sound, no GUI, slow hard drive & can't run most modern PC software) that, if it was all I had, I would look forward to changing it ASAP.

Of course, you can add upgrades -> spend spend spend.

I expect that it will still do all of the things that James says, It's just that I believe that the ST range has weathered better.

I've had an STFM since '88 & I was amazed that a machine manufactured a few years later was such a poor performer.

I've gotten real value for my money with the ST.

3178. Re: MiNT on Falcon (many troubles ;-)

Newsgroup: comp.sys.atari.st
Date: 1996-02-14 00:00:00 UTC
From: needhadp@eng.derby.ac.uk
Message-ID: <3121E808.4590@eng.derby.ac.uk>
Source record: 150570

Hello fellow falcon user..

I to have installed MiNT, about 6 times... I got my version via the mint installation kit, by who I don't know off hand. The install program crashed when it tried to make a minix partition, and crashed at a later stage when it didn't. In the end I set it up manually, not fun.

The best thing I found out was to patch multitos with mint utils, also I had a play with mint.cnf.

As for minix it may well need a 16MB partition, my 65MB disk was cleared and repartitions just for minix, it wouldn't created a V2 file system, or a null filesystem. In the end I got 12 character filenames and gave up at this point, it didn't seem worth the dirve space.

As for getting mint and geneva to work, well the V4 patch I got crashes partway through it's operation. However I have got the two working together, do this..

[Mint.cnf]

INIT=U:/c/geneva/geneva.prg

disable the GEM= line and edit the geneva path as needed, the reboot. Though don't use GNVATOS.PRG as it has problems, such as it won't work but with mint running you can use either miniwin or toswin as you like.

Only one further point, you will need to move most of the environmental variables from gem.cnf [multitos] to either mint.cnf or genevas gem.cnf, this is easy though. Also try setting the paths from U:, why I don't know but it does seem to work better.

If you want more info, not sure how much help I can be but what the heck eh?, E-mail me at:

needhadp@eng.derby.ac.uk

With your request and I will try and help.

One last point if you have got TCSH to look for TCSH.RC anywhere other than in it's own directory can you please tell me how. I have got the path settings right, both in mint.cnf and in tcsh.rc what now?

3179. What's the latest hardware from Atari

My Atari stock has been in my portfolio for years...completely ignored. I thought Atari was owned by Quorum, Inc. for some reason but I suppose not now that I see it is considering a merger.

I even used to own an Atari 1040ST but couldn't get much support for it. Had to go to a Mac becuase I couldn't afford to get left out in the cold again.

I truly thought Atari was dead... what's the story here? Are they still making computers? Any 68060 or PPC stuff?

Any info would be appreciated.

I know this may sound like a crazy idea, but why not buy Atari from JTS?
There must be thousands of Atari supporters out there.

If a large number of individuals purchased newly issued stock of a company
that would purchase the Atari name, logo, inventory, game rights, patents,
etc. and let JTS keep the company's capital and debt, I think that it could
be done.

Rumor is that the officers of JTS could care less about Atari and its video
game products.
Post to this thread if you think it might be able to be done.

>thread I was participating in as a 'victim'?
>If that was the case I was told to try out a program called
>'ovfix1.prg'.

It only affects demon users who connect to demon's Ascend modems
instead of their older USR modems and then only a small proportion. It
is not machine specific either.

Bascially, Nos does an "active open" which is either missed or ignored
by the ascends. The fix is to do another one, in this case manually.

When the opportunity arises I've been poking my nose into
demon.ip.support and d.i.s.pc asking what was done to fix the PC
version. Nobody will be surprised to hear that I have been ignored.

Never heard of Marcel WP.

The nicest Wordproccessor for Atari I have seen is definitly PAPYRUS GOLD.
And it's still being developed, and can be compared with MicroSoft Word.

In fact - it's a lot faster. At least on my Falcon.

It takes full use of SpeedoGDOS, NVDI 3 or 4. Which means you can use
fonts TrueType- and Speedo-fonts from the PC and Mac.

But you need a harddrive and a minimum of 2 MB of RAM.

> If I do decide to keep the machine, I will also probably want to upgrade
> the monitor. My SM 124 just won't cut it anymore. Especially when
> everyone else gets to use these big beautiful color monitors to do their
> work.

Well, it is possible to connect a SVGA color-monitor to the ST, but
it won't make it run in color or in a higher resolution.

The ST can't go higher than 640x400 in Black/White.

> I think I already have some info in this but additional info is
> welcomed.
>

Well I guess you better contact TOAD Computers, and find out how much
it will cost to upgrade your ST (or buy a Falcon).

d> Yes, I have an 8-bit Matrix Coco. Looking for ukp170 but it's been
d> unsold for a while so if you offer ukp150+postage I would probably sell
d> it for that :-)
d> Any help?

That's a pretty good price actually. I've got a Matrix CoCo for my MSTe as
well, which I bought on a second hand basis from System Solutions with both
Matrix and NVDI 2 & 3 drivers for 299ukp. It's been solid even if it doesn't
have a great colour depth - the resolution's there up to 1120*848*16
or 820*528*256 on my Idek/Iiyama 15".

All graphics card need some sort of SVGA (a VGA won't be up to the
capabilities of the card) so that's always extra cost.

I already knew that Overscan wasn't an option and when I found out a Reflex
card wouldn't work either, this was the cheapest bet at the time.

The Panther cards from System Solutions are certainly the best bet that's
ever been available though AIUI.

Hello mnb20@cam.ac.uk...

m> Hi Al. I see your brief spell using SLIP didn't put you right off
m> usenet, just off direct internet connections. I have to say that with

Indeed... in fact one of the main reasons for an Atari user to join the net
is for this newsgroup and Hensa access, but as you can now get both via
BBS's, and as I thought the transfer rate at Demon was more than abysmal I am
very happy with how things have turned out :)

m> NeST etc I've never bothered to read usenet from the Tavern, I read it
m> here because I haven't got any alternative.

The three CSA Atari newsgroups are now available as part of Turbonet, so it's
all nice and tidy :)

I reckon Everest is your best bet and seesm to meet all your requirements.
I have just registered my copy here in the UK at GBP11.00.

It's very stable, can be launched when files are passed to it. Fast to load
and it's a prg. It can even use your SpeedoGDOS installation to print out
in a selected font, but that's only an extra facility.

I use it for just about everything that needs a text editor, and it works
just great.

Okay, all you ST users out there. Take your right hand, reach over your left shoulder, and pat yourself on the back.

My recent adventures in PC land have shown me just how truly fortunate we ST users are and just how great the ST community is.

Our machines may be over 10 years old, but if you compare the support for our 10 year old machines to PCs of the same vintage, it is MUCH easier to find help and software for our machines than for on old 8088.

Recently I needed a copy of Dr. T's K5 editor to replace my dead copy. I posted a message here and my e-mail box was flooded with offers of assistance. Not only that, but all these people wanted in return was compensation for the disk and shipping. Well one guy who responded to my plea also needed a programme so I just sent him a disk with the programme he needed and a S.A.S.E. and he sent me the disk I needed. FANTASTIC!!

Now, recently I got a PC-EYE video digitizer card for $15 at a Goodwill. Unfortuately the software won't run on anything other than an 8088 (and the software is in BASIC too). Well there was a sheet with the card that mentioned better software that works with the card (Dr. Halo and Imigit). So I made inquiries about the software on the PC bases saying I needed that software for my 8088 to work with this video card. The responce was either complete apathy or rude e-mail along the lines of "Why are you using an old 8088? Get a pentium and a real video digitizer you idiot". Finally there was one guy who had the Imigit software and would make copies of it for me for $15! And this didn't even include photocopies of vital parts of the manual. When I got the software it wouldn't work and when I asked the guy what was wrong he got very rude and aggressive. He said it wasn't worth his time for the $15 I spent to help him but he took a look and it turns out he didn't send me all the files that were neccessary. So he told me to send him another $5 and he will send me those files too. I told him I had already given him $15 for one disk of non-fuctioning software and asked him if he couldn't just find it in the kindness of his heart to just send me the rest of the files I needed. I got back a very rude and insulting e-mail from this guy saying that he charges $100 an hour for his computer services and selling me this software just wasn't worth his time.

Well after this experience in the land of PCs I think it's safe to say that ST users are far more helpful than PC users who seem to only care about how much money you'll give them and wether or not you have the latest and greatest gear.

Sounds like it is a self-extracting file, in which case all you have to do is
double-click on it. You could probably also dearchive it by loading it into
STZIP or whatever.

Speak to 'ya later!

What happens if you just turn it on without a disk in it?

The software on the disk could be causing it to bomb. Without a disk,
wait (ages) then the desktop will come up. Plonk in a decent disk and
format it - then boot again with it in and see what happens.

: -President Tariland Computer Club Auckland New Zealand-
: (Tiny) Web Page: http://iconz.co.nz/~mbecroft

NVDI 3.x has such a driver built in to the pageprn.sys driver that comes with NVDI. I have used a friends Stylus Colour to print from Atari Works using TT fonts, although I have not used colour printing on it. You will need to give NVDI 3 some control codes to allow it to print colour, but software such as Pagestream already has colour support for this printer AFAIK...

Message-ID: <4fs9p3$phd@orm.southern.co.nz>
Source record: 150646

Hi There...

I have a friend who has a dead 1040STfm. After placing a disk in the floppy drive and turning on the power the machine reads the boot-sector of the floppy then resets itself. When it resets, a varied number of bombs flash on the screen just as it does so. I've done the usual like re-seat the TOS ROMs and all other socketed chips, plus check the motherboard for potential dry solder joints, but to no avail. Are there any problems with 1040STfm's that could cause the above to happen?

TIA for your replies...

> Nope... all TOS based machines can connect to an TV apart from the ST and STF
> :)

<nitpick>
My Mega ST can't do it.
My TOS based TT can't do it.

Therefore not all TOS based machines can.
</nitpick>

A rule of thumb:
If the model number of the "all in one" keyboard model STs have an "M" in
the name, they contain a TV Modulator. ("M" = "Modulator")

So, STM, STFM have modulators.
An STE is really an enhanced STFM, so it also has one.
An STF does not.
Neither do a Mega ST, TT.
A Falcon030 does.

Doesn't matter how many newgroups we have with atari in them, there will still
be people who post the same message to all newgroups available (though I've
yet to see FS: in .binaries. ;-))

It's just a pain downloading the same message three times in different
newgroups.

There, I've got it off my chest...

Andy.

Hi all

In article <4fnq7i$oq5@dux.dundee.ac.uk>
rmccall@mcs.dundee.ac.uk (Rod McCall) said:-

>Guess I should have bought That's Write then. I must admit I like Papyrus,
>but the lack of chapters, good colour handling and a word count is a bit of a pain.
>
>I'd like to see the following in Papyrus 4/5:
>
> good colour & image handling (gif/jpg etc)
> contents, index etc
> word count
> thesaurus
> good drawing tools (or atleast passable aka Word)

I have recently downloaded the German demo version of Papyrus 4. I have had
a play with it and there are some new features. Colour image handling is
there and can import colour TIF and GIF images. Lots of the functions
previously available only in the menu bar are now in an expanded ruler area,
i.e. font selection and size. That's a dramatic improvement.

There are simple text macros, which seem to consist of you typing
abbreviations into your text, which are then expanded by a key
combination. There are one or two other improvements, and some of the
functions have changed position in the menus.

One thing I have not discovered is the word count/text analysis, it may be
there, but I can't find it. The spell checker is there, and I would have
thought the word count would have been in that area, but no can find :-(

Unfortunately, I have to say that going on this German demo, some things
that are needed IMHO don't seem to be there, but PLEASE bear in mind that I
am looking at a demo version in a language I only have a passing knowledge
of, so I may have missed some things, plus the demo may well be limited,
though I have printed out perfectly from it :-)

Anyway, I think it is now time for all of us that want a proper
Speedo-based DTP program to start chuntering about it. Papyrus and That's
Write are excellent writing tools (with some reservations), and can handle
some simple DTP, but what we want is a proper DTP program.

IMHO, Timeworks 2.04 (Speedo version) is okay, but very limited, where's
the adjustable guidelines, text rotation, etc etc. There's nothing wrong
with Calamus except lack of hinted fonts which make output at point sizes
below 14 point pretty awful on 300 DPI printers.

Okay, I'm going off topic, so I'll start a new thread on the subject of
Speedo DTP elsewhere :-)

With the latest version of ICD utilities there is no need to put
ICDTIME.PRG in the auto folder. Just run it then use the control panel
to set the time, and this will reset the clock in the ICD host adapter.
You did remember to select the set time option in ICDUTIL.PRG didn't you?

The Atari dosn't have the control lines that the PC has. Even the PC's
25 pin parallel port isn't a real Centronics parallel port (36 pin connector).

You can find epson stylus color drivers for speedo gdos in:
ftp.cnam.fr in pub/Atari/?
They have been coded by two french developpers, and they install themselves automatically. They can print in mono, colours, using floyd steinberg dithering and others, using a vdi palette of 1 000 000 000 colours!
They use only 150 kb of memory, and are about 8 time faster than the mac-os to print a page. There are too cpx to configure everything.
Also available drivers for the epson stylus pro xl, canon bjc color...
If you can't find them ask me, I will mail them to you. It's public domain :-)

> The Atari printer port is an output-only port, and can't be read.

Rubbish. The fact is that some PC's have output only ports, where-as
all Atari's have had bi-directional ports from day 1. There are several
audio digitisers that use the parallel port - in fact ST/Amiga Format
issue 3 printed the designs for a simple one (I built it - and loved it).

The reason you cann't use PC parallel port peripherals on an ST is that
several of the non-essential (for printers) control lines are left out
(the ones dealing with stuff like paper-out). That's why you have to hack
a DLINK600 into the cartridge port instead.....

I don't have it either - but I built one myself to plug in the parallel
port and get a pretty good motion video frame rate in TC mode.

Craig.

:
: I'd like to see the following in Papyrus 4/5:
:
: good colour & image handling (gif/jpg etc)

It's there... It uses the HiSoft's EFMS file system, which means
it supports at least all the following formats:
degas, IMG, GIF, IFF, Imagelab, JPEG, MTV, PCX, Photo-CD (!),
Prism Paint, Spectrum, TGA, TIFF, Tiny

: contents, index etc

Table of contents and indexing are there, too...

: word count

This one's still missing, I think

: thesaurus

This, too.

: good drawing tools (or atleast passable aka Word)
:
I don't think these are as necessary as many other functions..
Papyrus offers adequate drawing functions (lines, boxes, circles,..)
- and when using a multitasking OS, one can easily use some real
drawing program (like Corel-Draw clone ARABESQUE 2) for drawings..

: Incidently what's the difference between TW2 & 3?

Some kind of a vector font support, though not good at all (IMHO).
Better appearance.

TW 3.1 is nice when writing long texts with no complex layouts, but
in everyday use, I think Papyrus 3.6x or newer is much more versatile.
I've used both, so this is just one opinion...

TW 4 again might be very good (not translated in English yet..).

Greetings,
Tommi

3241. DISCUSSION: Atari binaries/sources groups

Newsgroup: comp.sys.atari.st
Date: 1996-02-15 00:00:00 UTC
From: avg@cwi.nl
Message-ID: <avg.824400197@news.cwi.nl>
Source record: 150472

This is an informal `request for discussion' on the moderated Atari news groups

comp.binaries.atari.st
comp.sys.atari.st

A moderated news group, as opposed to a regular one such as comp.sys.atari.st, is a news group people can not directly post to---instead a human `moderator' receives all posted articles, and checks their content before they are actually posted.

The Atari binaries/sources news groups were created in times that ftp was not yet very popular, and the world wide web didn't exist; the news was a good way of distributing new software.

The groups are hardly used anymore. Most people prefer to distribute their software through ftp or through their home pages, where they can add as much information as they want, in a pleasant form of presentation.

Here's an indication of what is submitted these days on a MONTHLY basis:

- 2 regular postings at most

- 20 posts saying `what are these groups for?' `where is everybody'?

- 30 advertisements `who wants to buy my racy 520st?'

- 60 spams `100 sexy girls ready at there phones craving for your hard cock'

I therefore propose to permanently delete the groups from usenet. I don't think it is wise to continue the groups as they are now, and frankly not many people will miss them. Instead, one could make their programs available by ftp and post an announcement on one of the other Atari groups, or perhaps, if it is just a small source file, post it directly to comp.sys.atari.st.

I have checked with the authorities, and it doesn't seem necessary for such a low level group to go through a formal voting system. If someone were to take over the moderation job, they would experience they same problems as I am suffering now, and there simply is no way of improving the situation, nor is there any real need to do so.

Please note that I am not saying that I am looking for a new moderator, but would like to discuss the usefulness of the groups in general.

So, if there are no serious objections, I will request deletion of the groups somewhere early March.

tsyklon@aol.com (Tsyklon) spake thusly:

T > My Atari stock has been in my portfolio for years...completely
T > ignored.

I have a friend whose Atari stock certificates float around his basement on the breezes, with the rest of the trash. I find both his and your response to ownership completely sensible.

T > I truly thought Atari was dead... what's the story here? Are
T > they still making computers? Any 68060 or PPC stuff?

No, they are not. However, they licensed the Falcon design out to C-Lab in Germany, and two other outfits are making clones based on the TT or the Falcon (030 machines). There are 040s being made, an 060 (Medusa) supposedly waiting for Motorola to ship in quantity, and unless I miss my guess, a bunch of German citizens working feverishly to arrange for a PPC box with MagiC installed. MagiC is an OS that will run TOS programs. It will also do this stunt on a Mac, btw. See previous messages in this group, or a Toad Computers catalog for more info on the above subjects.

Don't forget that things run a lot faster from TOS than comparable prgs run from System7 or Win95 - the operating system overhead is pretty huge in the Mac or pc. And Mac and Win prgs tend to be pretty bloated, for whatever reason. So a 030/32Mhz machine like mine, or a 040 at whatever, are screamers, by comparison to machines with the same cpu/clock speed. Heck, my old ST (8Mhz 68000) looks pretty good compared to the last Mac 030/25Mhz that I saw.

Long answer, huh? I hope it is responsive.

I had this with my 520STFM (in fact it still crops up very occasionally) and on my machine at least it's just loose bits somewhere on the motherboard :-(I had some bother with the PSU switching off regularly as well and fixed this by taking it out and resoldering all the connections.

Well no offence but this is bull!
You can read in on the atari parallel port. I built and wrote the code for a
eprom burner which does just that. anyone interested and Id be glad to post the
sources.

Yes the ST doesnt have the same pins that a PC parallel port has but you can do
input to that port.

I found the info to do this in the ol ST internals book

Me too, as I have always thought these cheap scanners, in price I mean
:-)), for the PC must be usable on the ST/Falcon. Don't the expensive
Epson scanners from System Solutions need a special cable to a port on the
ST though?, as well as Atari specific software.

Anyway, I am sure that there will be a reasonable market for someone who can
come up with a decent software package for use with these flatbed scanners.

>Sunnyvale, Calif. (Dow Jones) -- Atari Corp. (ATC) and JTS Corp. agreed
>to merge.
[rest deleted]
Thanks for posting the update Phil. Makes me wonder what "synergy" these two organizations could possibily have. Being nearly totally ignorant of US tax law, I can only think of some kind of tax scheme ...

Ages ago I heard that a group of Atarians wanted to buy out Atari, maybe at the end of the year it'll be available for a few dollars :)

[BTW did Commodore rise again from its own ashes?]

Message-ID: <4fvpft$r00@enterprise.america.com>
Source record: 150490

Like the subject says, 4mb ST ram, 4 mb TT ram, 100 mb hd, no monitor, runs great. 1.44 floppy with whatever TOS version required that, plus the fdd controller chip. It has been awhile since I installed it, I can't recall the specifics.

Make me an offer, UPS COD.

I was wondering if there are any packages that support colour vector images for the atari falcon.

Does anyone know of such packages, and if so what are they called and where can I get them.

The new papayrus 4 has colour capabilitys but i have still not found if it supports colour vectors files.

I would be pleased if anyone would answer, as I have not got a clue on how to use colour vector art.

Not sure if the commodor 1902 will work as I'm not to familiar with C= product no's. I know some of C= colour monitors were based on the Philips 88833 / 52 series, if it's one of those
then YES it will work.
If $50 a good price ... depends if it works ;-)

Andy.

```
: Post to this thread if you think it might be able to be done.

It's a nice idea, but who honestly has the cash to purchace
Atari? Certainly not individuals ... even rich ones. With all their
patents, liscences, technology, brand name, logo and everything, the cost
of buying Atari would probably be over $100 million.

Try 7up or Everest- both of them are good, and both of them has
features the otehr one doesn't have- it all depends on your taste and
what you need. You can find them both (and several versions of 7up)
at: ftp.sn.no /user/hallvart/atari/

Assuming of course Sanppy doesn't make use of the signal lines not
implemented on the ST parallel port.

As this is what stops most PC type parallel adpators working - don't hold
your breath.

OTOH the cartridge port interface for the DE600 ethernet adaptor could
probably be pressed into service for thr Sanppy also.

:-)

Roland.

Don't count on the undelete function in chkdisk 3 too much! If
the file is fragged you won't get it all! Diamond Mirror on the other
hand makes sure that Diamond edge knows where to find all the parts of a
fragged file, as long as you haven't written over it, that is!

>how many computer companies dare to go against the grain in America today
>and try to fight Micro$oft?

Except that... MicroSoft is NOT a computer company.

MicroSoft writes software that runs ON computers.

MicroSoft wrote the BASIC interpreter that ran on my first computer, an
Ohio Scientific Instruments C1P.

MicroSoft also wrote the MS BASIC interpreter that ran on the Atari 800.

MicroSoft would write programs for the Atari Jaguar, if they thought it would
be profitable.

The most commonly used, and thus most profitable, computer platform now in use
is the Intel architecture IBM PC clone... so of course MicroSoft writes
software for it.

If another platform supplants the "PC", I'd expect MicroSoft would write
programs for it too...

As for computer manufacturers, Atari Corp had an excellent opportunity to
become one of the top manufacturers of computer systems when the ST was
released. MicroSoft had announced Atari ST versions of many of their most
popular programs.

Atari management simply blew it.

Me, I'm buying shares in C-Lab among others. Why? I wouldn't touch
anything that still has the Tramiels involved.

Originally Time Warner Inc. lent Jack Tramiel millions to buy Atari from
them, now 'JT and Son' are lending JTS money to buy Atari from them. Guess
what they say is true ... "What goes around, comes around"

3277. Farewell, Atari, pt. I

Newsgroup: comp.sys.atari.st
Date: 1996-02-15 00:00:00 UTC
From: markvanwyk@aol.com
Message-ID: <4fulue$kq5@newsbf02.news.aol.com>
Source record: 150543

SUNNYVALE, Calif.--(BUSINESS WIRE)--Feb. 13, 1996--Atari Corporation (AMEX: ATC) and JTS Corporation today agreed to merge the two companies. Atari is the pioneer in multimedia video entertainment and JTS is a manufacturer of computer disk drives.

"This merger puts us in a great position to capitalize on a very experienced management team and a rapidly growing disk drive market. JTS is using innovative technology, particularly in the 3" disk drive market, and we are excited about its prospects," said Jack Tramiel, chairman of Atari.

"Our partnership gives us the ability to expand our capabilities and pursue new opportunities," said Tom Mitchell, president and chief executive officer of JTS. "Dataquest has predicted that 115 million disk drive units will be shipped worldwide in 1996, and it is a great time for us to be participating in this market," said Mitchell.

Terms of the Agreement

Under the terms of the agreement, the new corporation will operate under the name of JTS Corporation and the officers of JTS will become the officers of the merged company. The Atari entertainment business and the JTS disk drive business will operate as separate divisions of the new merged company.

Atari has extended a bridge loan to JTS in the amount of $25,000,000. In the event that the merger is not consummated, the bridge loan will be convertible into shares of JTS Series A Preferred Stock at the option of Atari or JTS and subject to certain conditions.

As a result of the transaction, Atari stockholders will hold approximately 60% of the outstanding shares of the new company following the merger. The transaction is structured to qualify as a tax-free reorganization and will be accounted for as a purchase.

The board of directors of Atari and JTS have approved the definitive agreement. The merger is subject to certain shareholder and regulatory approvals and other conditions to closing. The parties anticipate the transaction will close toward the end of the second calendar quarter of 1996.

JTS Management Team

JTS was formed in 1994 by Jugi Tandon, the company's current chairman of the board. Tandon is well-known in the computer storage industry for his ability to develop innovative products for the marketplace. Tandon will remain chairman of the board of the new company.

Tom Mitchell was a cofounder of Seagate Technology and president and chief operations officer of both Seagate and Conner Peripherals. Mitchell brings unparalleled industry and operational experience in the high-volume disk drive market. He is a pioneer in disk drive manufacturing in Singapore, Thailand, China and India.

About Atari Corporation

For more than twenty years, Atari has provided consumers with high-quality, value-priced entertainment. Atari markets Jaguar, the only American-made, advanced 64-bit entertainment system and licenses and markets software in the multi-platform, multimedia market. Atari is located in Sunnyvale, California.

About JTS Corporation

Founded in 1994, JTS Corporation develops and manufactures hard disk drives for the computer industry. JTS has recently introduced its new 3" Nordic product for the portable computer market. Headquartered in San Jose, California, with manufacturing facilities in Madras, India, JTS employes 1,300 people worldwide.

The above statements regarding the disk drive industry and JTS' prospects are forward looking statements and involve a number of risks and uncertainties. Among the factors that would cause actual results to differ materially are the following: business conditions and growth in the portable computer industry and in the general economy; competitive factors, including pricing pressures; availability of components from third parties; risks associated with manufacturing of products in India or other overseas jurisdictions and risks associated with JTS' ability to ramp its manufacturing operations, including cost and yield issues.

Source record: 150544

SUNNYVALE, Calif., Feb 13 (Reuter) - Atari Corp said Tuesday it agreed to merge with <JTS Corp>.

Atari also said it has extended a $25 million bridge loan to JTS. In the event that the merger were not completed, the loan would be convertible into JTS Series A preferred shares at the option of Atari or JTS, subject to certain conditions.

As a result of the proposed transaction, Atari stockholders would hold about 60 percent of the new company's outstanding shares following the merger, it said. The transaction is structured to qualify as a tax-free reorganization and would be accounted for as a purchase.
Directors of both companies have approved the definitive agreement, Atari said. The merger is subject to certain shareholder and regulatory approvals and other conditions to closing. The parties anticipate the transaction will close toward the end of the second calendar quarter.

Under the agreement, the new corporation will operate under the name of JTS Corp and the officers of JTS will become the officers of the merged company.

The Atari entertainment business and the JTS disk drive business will operate as separate divisions of the new merged company.

JTS was formed in 1994 by Jugi Tandon, the company's chairman. He will remain chairman of the new company.

Tom Mitchell, president and chief executive officer of JTS, was a cofounder of Seagate Technology Inc <SEG.N> and president and chief operations officer of both Seagate and Conner Peripherals Inc <CNR.N>. -- New York Newsdesk 212-859-1610.

09:15 02-13-96

SUNNYVALE, Calif. (Reuter) - Atari, the multimedia games company, said Tuesday it agreed to merge with JTS Corp, a privately-held maker of disk drives, and will take on the JTS name.

Atari, maker of the popular video game Jaguar and other titles playable on Atari's dedicated platform, has met with stiff competition from other games makers such as Sega as well as from personal computers.

An Atari spokesman said that the company was looking for a strategic investment.

``We had $50 million in the bank,'' said spokesman August Liguori, from Atari headquarters in Sunnyvale, Calif.

He said that in the past, Atari had sold computers, printers and other computer components. ``To some extent we are going back into the computer business'' by merging with JTS.

The new entity will be known as JTS Corp, but Atari will still exist as a brand name.

The Atari entertainment business and the JTS disk drive business will operate as separate divisions of the new merged company.

Reuters/Variety

18:02 02-13-96

BETHESDA, Md.--(BUSINESS WIRE)--Feb. 13, 1996--In today's news alert to subscribers, Multimedia Wire reports that Atari is actively in negotiations to license its video game assets including hardware, software and various patents to another company or entities.

As previously reported by Multimedia Wire, the interactive entertainment news service, Atari Corp. will merge with a computer components manufacturer (JTS Corp.). Multimedia Wire first broke news of the proposed merger in an exclusive report on Jan. 18, 1996, suggesting at that time the company would exit the video game business.

Atari's exit of the video game business is still a possibility -- should no licensees surface. Licensing discussions have been taking place over the past several months, Multimedia Wire has learned. Any such licensee would likely be responsible for further software and/or hardware development, marketing and distribution.

"The news of the merger could very well hold opportunity for Atari shareholders," said Chris Sherman, editor of Multimedia Wire, "but it leaves in question the state of Atari's video game hardware and software business, particularly the Atari Jaguar."

Multimedia Wire has learned through sources close to Atari that Ted Hoff, former president of Atari's North American operations, was in discussions with several major Atari shareholders to take the video game portion of the business private. Those discussions subsequently fell apart.

Atari's video game assets include its Jaguar console game machine as well as such classic video game titles as Defender and Tempest. Additionally, Atari owns several patents.

"Regardless of the outcome, the landscape of the video game industry changed significantly today," said Sherman. -0- From Multimedia Wire 1-18-95

Atari exiting video game business, liquidating gaming assets

Atari Corp. is throwing in the video game towel. Company sources tell MMWIRE Atari is liquidating all its video game assets, including the Jaguar, Jaguar CD and Atari Interactive, the company's recently launched PC software division.

It would appear that the Tramiel family, the largest Atari shareholders (with approx. 47%), have decided to apply Atari's $50 mill. cash reserves in a business other than video games -- or any consumer product for that matter. The sudden move comes on the heels of the recently launched Atari Interactive.

Just last week Atari told MMWIRE it expected to use a portion of that $50 mill. to invest in video game software companies.

The closed video game division leaves behind an installed based of 150,000 Jaguar game systems and outstanding title development contracts amounting an estimated $6 to $8 mill. Approx. 20 employees have been laid off, leaving 30 remaining. These too are expected to depart shortly. Layoffs include the entire Interactive division including management, accounting and legal personnel.

The Tramiels intend to exit the video game business, liquidating those assets. MMWIRE believes the Tramiels intend to merge the resulting company with a computer components manufacturer.

While it is not known who Atari intends to merge with, the combined companies are expected to trade under the current Atari stock symbol (amex: ATC). -0-

Jaguar Game Maker Atari to Merge with Disk Drive Maker

By Mike Langberg, San Jose Mercury News, Calif.

Knight-Ridder/Tribune Business News

Feb. 14--Atari Corp.'s long, strange story took another odd twist Tuesday as the Sunnyvale video company announced plans to merge with JTS Corp., a start-up manufacturer of computer hard-disk drives in San Jose.

Once the deal is completed in May or June, the combined company will take the JTS Corp. name -- although Atari Corp. will continue in business as a subsidiary manufacturing the Jaguar video-game system and developing personal computer games.

Atari shareholders will own 60 percent of the merged company. Atari Chairman Jack Tramiel and his family now hold 42 percent of Atari stock, so they'll get 25 percent of the new entity.

But Tramiel, who took control of Atari in 1984, won't be the boss. He'll take a seat on the board of directors, while JTS will continue to be managed by two disk-drive industry veterans: Chairman Jugi Tandon and President Tom Mitchell.

Tramiel and his son Sam, now Atari's president, will continue to run the video-game business for at least the immediate future.

Atari has been nearly swamped by years of heavy losses, and the Jaguar has never become a credible force in the $6-billion-a-year video-game industry. Only 150,000 Jaguar units have been sold since the system's launch two years ago; Sony Corp., in comparison, has sold more than 500,000 of its Playstation units since their introduction in September.

Despite its red ink, which includes a loss of $22 million on sales of just $12 million in the first nine months of 1995, Atari has always held onto considerable cash reserves and now has about $50 million in the bank.

"We had a surplus of cash and I felt we needed to invest this cash in areas other than the game business," Tramiel said Tuesday.

Atari may be trading one big risk -- the video game business -- for another. The disk-drive industry is huge, but constant pressure to make higher-capacity drives at lower costs has forced numerous companies into 4bankruptcy.

Up front, Atari is providing an immediate bridge loan of $25 million to JTS; if the merger falls through, the loan will be converted into JTS stock that will be retained by Atari.

Tramiel also denied persistent reports in recent weeks that Atari intends to sell its few remaining assets. The company has laid off almost its entire staff, and now functions with a skeletal crew of 30 people in Sunnyvale and 10 workers at an office in the United Kingdom.

Atari was founded in 1972 by Nolan Bushnell, who invented the first video game -- "Pong." The company grew to become one of the biggest in Silicon Valley and was sold to the company that is now Time Warner Inc. before nearly collapsing in the early 1980s when consumers suddenly grew bored with video games.

JTS, in contrast, is growing rapidly.

The company was formed in February 1994 by Tandon, when he bought the assets of a defunct disk-drive company called Kalok Corp. Tandon had previously founded Tandon Corp. of Los Angeles, which made disk drives in the 1970s and early 1980s, then switched to making PCs. Tandon Corp. fell victim to the first big PC price war in 1992 and entered bankruptcy proceedings in early 1993.

Tandon first met Tramiel in the 1970s, when Tandon Corp. supplied disk drives to Commodore, a computer company then owned by Tramiel.

Mitchell, JTS's president, worked for Tramiel as Commodore's general manager in 1978 and 1979. He then left to help launch Seagate Technology Inc. of Scotts Valley, now the world's largest disk-drive producer. Mitchell left Seagate in 1991 to become president of Conner Peripherals in San Jose, then moved to JTS last year before Conner was acquired by Seagate.

JTS, which has 160 employees in San Jose and 1,300 workers at a disk-drive production plant in Madras, India, is trying to convince laptop PC manufacturers to switch to a new type of hard disk. Laptop computers today use 2.5-inch diameter hard drives, which are more expensive to manufacture than the larger 3.5-inch drives that are common in desktop PCs. JTS is offering a compromise: a thin 3-inch drive that shares the low-cost manufacturing methods of 3.5-inch drives, while taking up no more space than thick 2.5-inch drives.

The company has gotten an order from Compaq Computer Corp. of Houston, which is expected to ship laptops with the JTS drives by June. Compaq has also helped fund development work at JTS and has convinced another disk-drive manufacturer, Western Digital Corp. of Irvine, to start making a small number of 3-inch drives.

But JTS still faces a considerable struggle in convincing laptop makers to switch to 3-inch drives.
"It's my understanding Compaq's interest is still somewhat limited," said Robert Katzive, vice president of the research firm Disk/Trend Inc. of Mountain View. "Maybe there's room (for 3-inch drives), we'll just have to see." ----- FOR ONLINE SERVICES: Visit Mercury Center on America Online (keyword: MERCURY) or Mercury Center Web, the World Wide Web site of the San Jose (Calif.) Atari's profile lowered in JTS merger Video games will be on back burner after deal with disk- drive maker

Tom Abate
EXAMINER TECHNOLOGY WRITER
Examiner wire services contributed to this report.

One of the best-known names in technology took a big step toward obscurity Tuesday, when Atari Corp. said it would become part of JTS Corp., a disk-drive maker.
Although Atari shareholders will own a majority of JTS shares, JTS management will run the new company's day-to-day operations,and Atari's failing game business will be put on the back burner. Atari launched the video game revolution with its invention of Pong in the 1970s. "To say this name Atari, which many people know, is going away is not exactly true," said August Liguori, Atari's chief financial officer. "But it will not have quite the same profile."
Atari's most recent venture, the Jaguar video game, met stiff competition from other games makers such as Sega Corp., as well as from personal computers.
"Jaguar was certainly a disappointment," Liguori said. But he put the emphasis on the new possibilities of the JTS merger. "Atari was looking for a strategic investment going forward with the $50 million in the bank," he said. "JTS is in a start-up mode with good technology" in disk drives.
Atari will issue 40 million shares to JTS and extend a $25 million loan. Based on Atari's closing stock price of 2 1 / 16 Tuesday, the transaction would be worth about $82.5 million.
As a result of the proposed transaction, Atari stockholders would hold about 60 percent of the new company's outstanding shares following the merger.
Executives reshuffled
JTS Chairman Jugi Tandon will be chairman of the merged company. He founded JTS in 1994. Atari Chairman Jack Tramiel will become a JTS board member. But his son Sam, Atari's current chief executive, will leave the merged company when the deal concludes toward the end of the second quarter.
If the deal falls through, the $25 million bridge loan would be convertible into JTS Series A preferred shares. The Atari entertainment business and the JTS disk drive business will operate as separate divisions of the new merged company.
The new entity will be known as JTS Corp., but Atari will still exist as a brand name to sell some video games for Jaguar, and to convert some of its games to PC format.
Open to new opportunities
"Our partnership gives us the ability to expand our capabilities and

pursue new opportunities," said Tom Mitchell, president and chief executive officer of JTS, who will remain in those positions in the merged company.

Mitchell was a co-founder of Seagate Technology and president and chief operations officer of both Seagate and Conner Peripherals. Tandon, Mitchell and Jack Tramiel were all business associates when Tramiel was at the helm of Commodore Computers in the early 1980s. "These are people who know each other," Liguori said.

The new company will have its headquarters in San Jose, where JTS is currently based. Atari has 30 people in Sunnyvale, Liguori said, and JTS has about 175 people.

"There will be some layoffs," Liguori said, "but not as a result of the merger. Atari has been streamlining its games division to get it into the black."

I don't understand why you would want to install an old version of MiNT
(v.95 or .96) from the MDK when the Multitos version of MiNT is v1.04 (I
think)? Wouldn't you be better off just popping in the v1.12 MiNT binary
into your auto folder? As far as getting a minix file system, use v.60
from umich (IIRC v.55 came with MDK.)

minixfs v.60 will do a V2 file system and can use larger partitions.

You mean a spell checker, yes it has about the best I've seen. You can have multiple dictionaries loaded and when you find a word it doesn't know you can choose to add it to any one of them. It gives words it doesn't know a ssquiggly underline (like Lotus' WordPro. Only Papyrus did it first)

I have to agree with you 100%. I was kind of shocked when I heard
Atari mentioned on the radio wednesday morning. I thought I heard them
wrong at first. Then I asked myself what do I care. I have a jaguar, so
that part is somewhat worrying, but in general they haven't given a damn
about any of us in c.s.a.st for some time now. There was support from
some of their employees who were ST people, but the main company didn't
care.

And of course they always outlasted CBM ;)

So is the only answer to this the following:

Jack was tired of his sons ruining his investment. So he comes in
sets up a merger where the meager amount of money they have left is given
to a different company and Sam hits the streets?

Couldn't blame him if it were true. Money seems to be the only
explanation for the whole merger. What does atari have left realy that

anyone would want outside the posibility of the Jag Chip set. Factories are all long gone. All the real estate sans 1 building is gone. Most of there patents are about to be gone. What is there except the 50million?

I downloaded a file called bobtrack (from the newitems directory on umich) and it looks like a very nice MOD player, but I haven't had any luck with it, and wanted to see if anyone else can get it to work?

Basically, when I load a MOD, I hear a click on the speakers, but when I press the play button, either nothing happens, or I get a varying number of bombs (once I got two, and another time I got four). I thought that maybe the bombs were a conflict with another DSP MOD player already loaded as an ACC (MegaPlayer .096b), so I simply booted while holding the CONTROL key (to bypass any AUTO and ACC loading). At least now I don't get bombs, but I still get no sound.

It will run if DSP works as normal, and the acceleration is done
"legally" - if the machine works 100% when accelerated, CAF works
also.

>2) Can CAF use Fast Ram for its RAM tracks?

Dunno.

>3) Will CAF ever be in color?

I doubt it. Latest info is that Avalon is discontinued (there will be
no Avalon 3), and Atari-platform is only supported, not developed any
more (which means there will be bugfixes but no new features).
I stress this info is not official, you have to get that from
Steinberg.

Why would they do a feature (color) that would work only on highly
accelerated Falcons (10-100 CAF users in the world might have
accelerated machines) anyway?

Good point, especially from r.g.v.*!!!!! :)

Relly though, I'd get Hoff back & let him call the shots. Put Minter in just below him or in charge of programming. What's David Crane of VCS Activision Barnstorming fame up to these days? Nolan Bushnal? I'd give any of these talented people profit sharing out the wazoo to encourage them not to come out with Club Drive's or Checkered Flags. I'd get a crap load of people working on re-makes of classics, exact remakes, & put Minter & Co. in charge of 2000izeing them. What about the team who put MC3D together - they did great! Take Crap games like those mentioned above off the market - I'm sick of going in Babagges & seeing lots of Checkered Flag, Club Drive, Cannon Fodder, Theme Park, Brutal Sports Football, Troy Aikman (whatever) Football & *NO* Tempest 2000, Alien VS Predator, Misille Command 3D, Iron Soilder, Battlemorph, Defender 2000, etc... I say with the expanded CD take Hover Strike cart off too. Bite the bullet & come out with some alternative controllers; like, A ROTARY CONTROLLER!!!! AN ARCADE TYPE JOYSTICK & FIRE BUTTON COMBO FOR BOTH RIGHT AND LEFT HANDED PEOPLE! A TRAK BALL CONTROLLER! I've no doubt people would buy these for use with the proper games. (T2K, D2K, MC3D)

Advertising:
There's no way Atari can compete with the unholy trinity of Nintendo, Sega & Sony. It just costs *way* too much to have a comercial on every other comercial break on places like MTV. They could do some SMART advertising though. The post cards were a real good idea & I say expand it. Have a big advertising blitz right at first. Pick a big day/event on TV and actually have a few comercials then. Have good ads in the magazines for that period. Send post cards out not only to Jag owners but dig back in those records, way back, send one to EVERY Lynx, 7800, 5288, ST, 8-bit, & VCS owner they can find. Sure, it would cost a bundle & lots might not ever get their card. Emphise on the fact that Atari is under new management & the Traimels are out, $99 Jag, D2K, T2K, MC3D & Breakout 2000. I bet you'd get a response...

Daydream over,
JJH

3295. FALCON QUESTIONS (CAF)

Newsgroup: comp.sys.atari.st
Date: 1996-02-16 00:00:00 UTC
From: bili6745@mach1.wlu.ca
Message-ID: <DMunp1.GL5@info.uucp>
Source record: 150411

I'm soon to be the owner of a Falcon. I have used ST's for all computer work for about 6 years now and know that puppy inside and out. Is there a FAQ floating around anywhere listing the 'must have' programs and set ups to get the most out of a Falcon? (with Cubase Audio.)

I'm also interested in hearing from those of you who use CAF alot. Realisticly, just how much space can I expect to use up for HD recording? (If it matters, mainly I will be recording voice and brass instruments.)

>were you?. Today it closed at $2.75 = $175M.
>--
> jorcas@netcom.com

I think the stock was over $3 today. I bought last week at 1 and
15/16 and sold today somewhere over $3. When I bought last week it
was on the basis of their current ratio. I was right; they bought
something with all of that extra cash this week and the brokerages
like it. I don't understand this company enough to keep my money in.

I'd always wanted to make money on this stock and it looks like I
found the opportunity. If you're still in, hopefully it will hit $6
or $8.

Andy (very happy with something like +40% after taxes in less than a
week)

3300. WANTED: Dealers for SwapMeet: Pacific NorthWest!

Newsgroup: comp.sys.atari.st

The next SwapMeet is Monday, March 4th, 1996.

WANTED: Dealers to sell at Upcoming Swap Meets. Dealerships sought fall into such Categories as Computer Dealers, all kinds. All kinds of Computer HardWare, SoftWare, Peripherals & Accessories for ALL Computer Makes and Types.

Also Sought are Dealers in Video Gaming Equipment, such as Video Game Consoles, Cartidges, Video Game CD Players and Video Game CDs. ALL Video Game Makes and Types. ALL Video Game Consoles, Cartridges, CDs, Peripherals & Accessories.

At the March SwapMeet we have a Panasonic 9 Pin Printer offered as a Door Prize! Just show up for the drawing and if you have the Luck of the Irish. You might come away the Lucky Winner!

Recruiting New Dealers with Membership for Dealer Value. You could setup at a full year of swapmeets, 12 Monthly swapmeets at $10 a Meet, for $120 a year, or join our group and setup ***FREE*** for a year for ONLY $50! Greater than a 50% Savings!

Also Wanted are Dealers in ALL Types of Electronics.

WANTED are Dealers in Ham Radio, CB Radio, Music CDs and other Recorded Music. Stereo Equipment also Wanted.

Also Wanted are VCR's, Video Tapes, TVs and Satelite Gear.

This is an ALL Computers, Game Machine and Electronics Swap Meet!!

Small Businesses, and Dealers Welcome and Wanted!!

NO ADMISSION CHARGE!!! PLENTY OF FREE PARKING!!! NO ADMISSION CHARGE!!!

TABLES $10! TABLES, FIRST COME, FIRST SERVE!

Swap Meet Location in Portland, Oregon. USA. At 1819 N.W. Everett St. at the NorthWest Service Center On the First Monday of each Month.

To find out about more about the Swap Meet call our 24 Hour Recorded info line at (503)650-7196 or for Live info, call from 3 PM - Midnight, Monday - Thursday, Friday 3 PM - 6 PM. Please call, especially dealers at: (503)256-9974 (VOICE/VOICE MESSAGING), leave your home number if Ben is not answering!

Is it the file with the name of BBS DreamWave in the header? If so, it probably is an escaped version of a browser that was develloped by the author of Oasis. When I contacted him last fall, he was surprised that the version was circulating. He said he would finish the browser soon, to incorporate it in Oasis. Never heard anything anymore about the project.

Marc.

It's also slower than a dead dog! Which is the sole reason I haven't
registered it. It's a shame really because apart from it's distinct
lack of speed, it does just about everything you could want!

Wouldn't risk trying it on a mega st though - it crawls on a Falcon.

Not with italics, but with outline effects. As soon as I installed the HP Laserjet 4 printer driver I get a crash whenever I use outline. Fortunately I never use outline anyway. :)

This may well be a SpeedoGDOS bug rather than an Atari Works bug - I shall find out if/when NVDI 4 ever gets here...

: MS baggage. They may buy it, but they don't need it.

Couldn't have put it better. Macs too expensive, PC need reworking totally, my Falcon needs a bit more speed and larger following (probably buy a speed enhacer in the meantime).

I'm gonna sit this one out until a NEW computer comes out - one thats at the right price with the up-to-date architecture (maybe I could afford an old workstation by then). Too many people following the wrong person if you ask me.

I did read a story about the pentium chip having anly a few more upgrades left in it. They are aparently reaching the end of poosible hardware enhancement for that design. Lets hope its true and a new amazing chip will be designed and magic comes out for it.

I think you can install a 3.5" IDE drive in a Falcon but you would have
to find an alternative mounting method and also the ribbon cable that
feeds the original 2.5" drive will not work (as is) with a 3.5" drive.
Good luck! :)

Hi claes,

Yes, I have tried to partition a zip disk and can therefore transfer files
between PC and FAlcon. However, it is not recommended to partition removable
drive, so I was told.

>I've also heard of a program called BigDOS, which should be able to use
>PC-formatted harddisks of up to 2GB, but I'm not sure I've understood
correctly
>- has anyone tested BigDOS?
Does anyone know German in this group? I have read some info about this but I
just can't figure out how to set up. Please contact me if you can help.

From: michaelk@pacifier.com
Message-ID: <4g12b1$qak@news.pacifier.com>
Source record: 150427

About 40% of the time my second external HD (Maxtor 530MB fast SCSI II) is recognized by the ICD protools SCSI boot BUT the partitions are NOT recognized. My other external HD Seagate 1030MB is always recognized-- partitions and all. I might add the rest of my SCSI chain (always recognized) are Syquest, & CD-ROM Drive. I'm careful to start things sequentially (although I've experimented to see if that makes a diffrence). As I've suggested the majority of the time it boots ok. Any suggestions as to the cause of lack of partition recognition?

: I've been using Supercharged Easy Draw for the past week and like it, but
: has some stupid quirks like only loading the first five fonts from your
: font manager (I have NVDI 3) and having a limited few preset point sizes
: instead of a proper font selector box with user definable size.
I have Easy Draw too, and I have to agree with your assessment of the
font system.
: Anything better than this? I would be particularly interested in anything
: that'll *use* my font scaler in NVDI! So far I've only got rusty old progs
: that came with Atari's ancient GDOS :-(and they tend to exhibit the same
: lack of control and features with respect to font handling (fixed sizes etc.)
There's Kandinsky, which supports Speedo (and hence NVDI, I would
imagine) as well as colour art. It'll also export in various formats
including Postscript. The shareware version appears to be fully
functional except for zoom and exporting. I haven't actually tried saving
or printing anything, but those are probably disabled as well. IIRC, the
registration fee was around 70DM, but don't quote me.

These specify min and max adjustments that will be made to your system clock after reading the time from your provider. Adjustments outside the range are ignored. I'm not too sure exactly what they mean to be frank.

time server <server_name | ip_address>
time auto <on | off>

are what you need. Ask your provider for the recommended time server name or address. "time auto on" will set your clock soon after connecting - "off" obviously doesn't.

For some reason my system time gets totally screwed up if I have it turned "on". If you have a resonable system clock or can be bothered to set the time manually then the time server can be dispensed with. If you do this then make sure your system clock is always very slightly behind the real time to avoid missing the odd news article.

The HISTORY file keeps track of which articles have been received so keeping your time slightly behind ensures you do not miss articles but will not download the same article twice.

A typical "bug" is having the time set into the future - you get no articles. If you suspect this take a look in SPOOL\ARTICLES\NNTP.DAT at the first line which contains the time and date of the last successful newsfeed. Judicious use of a text editor allows you to set this date to a more reasonable setting.

Setting it into the past allows you to get news which you have already received - useful if you have erroneously expired stuff you want, provided it is still on the server. You must also remove the article headers from the HISTORY file (or just delete it altogether). Going too far back in the past will result in a huge newsfeed!

TOS as opposed to GEM has always had the ability to change resolutions as and when you want. I don't really know anything about STOS but I would be surprised if used Gem for speed reasons.

There is no theoretical reason why Gem can't change resolutions but in practice there is too much work involved. Gem is resolution independant so you are not just asking for the program to be able to switch between medium and low resolutions you are asking for the program to be able to hope with any horizontal and vertical resolution plus colour depth you care to dream up.

So the main process decides to change from lo rez to medium - what happens to your desktop accessories? The situation is even worse under multitasking - process A wants resolution A, process B wants resolution B etc.

A Gem program cannot feasibly make these changes. What it can and ought to do when it starts up is find out what the current resolution is (width, height, colour depth) and adapt itself to the current resolution. I believe this slight change of approach allows MultiTOS to support resolution changes but I am getting into an area I know little about.

Somebody else care to explain the mechanics of a MultiTOS resolution change? Are processes just stopped and restarted or is there a resolution change message and associated responses?

From: fredu@enterprise.america.com
Message-ID: <4g34sv$jp@enterprise.america.com>
Source record: 150434

includes 4" hand scanner in same bundle, works with same cartridge unit, also includes touch-up and Migraph OCR, great programs, ran on my TT as well as my ST. 100-400 dpi scanning, black and white, of course.

Scans 8" wide to 14" length in single pass. Includes manual for Touch-up and original disks for all. If I can find the OCR manual, will include that too. So easy to use you probably won't read the books anyway!

As usual make me an offer. I was a post for this for $200, so I will consider anything along those lines.

3319. What's the latest hardware from Atari

Newsgroup: comp.sys.atari.st
Date: 1996-02-16 00:00:00 UTC
From: daymon@sierra.valleynet.com
Message-ID: <4g2ipf$ngi@alpine.valleynet.com>
Source record: 150435

Atari has been out of the computer business for a few years, focusing all thier resources on the Jaguar 64-bit video game system. The last computer was the Falcon, a 68030-based multimedia machine. The latest efforts to produce new machines has been in the hands of third-party companies. C-Lab of Germany makes three newer versions of the Falcon. If you want a better CPU than the original 16MHz 030, you can either get a clock accelerator up to 40MHz (BlowUp FX) or replace it with an Afterburner040 card (up to 80/40MHz according to toad computers). Even with the 16MHz CPU, it's performance is pretty fast because of the included DSP running at 32MHz (up to 50MHz with BlowUp FX), an optional and relatively inexpesnsive FPU at 16MHz (or more with FX), and the normal BLiTTER, sound, and DMA coprocessors. I've heard rumors of C-Lab developing 060 and PPC based machines in the (near?) future. Other computers out there are the Eagle, Medusa (uses 040 or 060, I think), and Direct30 (a clone of the TT030, a 32 MHz machine Atari made before Falcon), made by Computer Direct in Canada. I don't know a whole lot about these, tho. I have recently ordered the C-Lab Falcon MK-X 4Mb/540Mb, to which I plan to add a CD-ROM, Afterburner040, and more memory in the (near/far?) future. If you need any more info, I'd contact Toad computers: http://www.toad.net/ or e-mail:info@toad.net. They have a very complete catalog of Atari, PC, and SOME Mac stuff (specifically MagiCMac, which places a re-write of TOS on a Mac so you can run Atari software). Hope this helps!

In a message of 16 Feb 96 gary@tequila.demon.co.uk (90:100/106) woffled
to All :

g> # Attach the SLIP driver to the serial port
g> # if port 0 slip dev buff mru baud
g> attach asy AUX: 0 ppp sl0 32767 1500 110

Cheers I will give that a go, but how do you stop NOS saying it's an
invalid baud rate?

I'm now using:

attach asy AUX: 0 ppp sl0 32767 576 57600

Which does seem to give a high connect, although both HSMODA06 and the CPX
are set to use 134 which equates to 57600 baud. I did try to use the 134 in
NOS but it did not seem to get a connect at all.

g> You must also have HSMODEM6 installed and the modem CPX set to 110
g> I had problems with my modem port locking at 19200 until someone
g> gave me the above infomation.

Which modem was this with?

g> BTW the CPX is very important as it seems to act as a link between NOS
g> and HSMODEM6.

Yep, I know that one.

g> Any problems and you can have a copy of my settings.

Ok, we'll see how it goes.

>things that don't fit on one floppy?

Following that suggestions, heres one that refines it slightly, so you
need less floppies !!

First off, if you have enough Harddisk space (about another 2.5Megs)
and plenty of time, then archive it (3megs will take a while, probably
about 15mins tops !), using ZIP. This should decrease the size quite
a bit..... before you go sending it anywhere dearchive it to check it
wasn't corrupted !

Then get a copy of MegaFLI, which is a PC and ST program, and allows
you to join and split files on both machines, however unlike Mime,
UUe, or Ship it doesn't expand the file..... then they can use the PC
version to re-join it. Otherwise just use Esscode to fragment, and
then join, pick the method (not UU) that exapands least, probably SHIP
!

ATb.

>Try Everest, it's shareware. It's Very Very Good (and fast).

If you want a real good editor, better try 7up first, it's arguably better.
It has _all_ things Everest has, and much more too, like:

-Text-preview
-ST-Guide format Help & Docs
-All 'dialogs' in windows
-Unlike Everest, Alt + numkeypad works in dialogs, too.
-Can do various calculations
-Better search & replace, can search in complete paths too (grep)
-Rectangular block-mode possible (if you once needed it, you understand)
-Nice configurable toolbar inside each window
-Each window is completely independent, ie. different fonts per window etc.
-FULLY user-configurable: names of menu-options, keyboard-shortcuts, etc.
-Auto-save option both by time and upon exit
-Very nice block-handling

Of course it works fine under multitasking (that goes without saying).

It's easy. What you can't do is get GEM to work in the new resolution. The
only way to do that is to restart it, which is what the desktop's change
resoluiton dialogue does.

STOS programs and Photochrome don't use GEM so they don't have a problem.

Interesting... you must have a very low quality disk supply! I have cheap
unbranded DSDD disks formatted to 84 tracks, 21 sectors high density!
Around 1.6Mb on a DSDD disk - and they are very reliable. I formatted the
lot a few years ago and have yet to get one error on them. My HD is
backed up on them...

NetBSD does not require an FPU (linux does AFAIK) but does not support the
IDE drive - you can only use partitions on a SCSI device with it.

Extra tracks tends to either work well or hardly at all, depending on
the drive. Since you are using more of the disc rather than squeezing more
data in to the existing space, if it works at all it's as reliable as the
other tracks. Obviously your drive is one of the better ones. I've never
managed beyond 82.

Any drive can do more sectors but they can be less reliable on some discs,
as you are trying to get more data in the same space so it can be quite
sensitive to bad quality media. I never had a problem getting 10 sectors on
though.

From memory, American patents last 17 years, unless renewed. So, it is
semi-safe to assume that anything patented up to 1978/9 is now "free".
(that would mean most US patents prior to #4000000).

And I believe that there is a fixed limit on how many times it may be
renewed.

So, assuming Atari patented it's ST technology in 1984/5 then they run
out in 2001/2. Lynx (1990 -> 2007), Jaguar (1993 -> 2010)

(Disclaimer: Not a patent lawyer, or wanting to be one)

BTW: what assets do they have (excluding patents)? I am thinking here of
plant, machinery, stock, investments.

Sum those, and you have a nearly accurate sale price IMV.

3336. Changing resolution...

Newsgroup: comp.sys.atari.st
Date: 1996-02-16 00:00:00 UTC
From: ashort@mettav.demon.co.uk
Message-ID: <8490_ashort@mettav.demon.co.uk>
Source record: 150495

Hello...

It is possible to code into all STOS programs the ability to change to the correct resolution for that program without having to reset the machine. For example, if you are in medium resolution and the program needs to be run in Low res, the program will change to the correct resolution for you on execution..... no messing about with chaning the resolution via the desktop and having to wait for the computer to re-boot itself.

Photochrome, a non-STOS program has the same ability.

If this is the case, and it is so easy for all STOS programs and Photochrome to manage it, then why isn't it possible to have a small program or .acc that you can run which will change the screen resolution for you without having to re-boot the whole system?? :|

Yeah, tell THAT to SEGA! I'd say Atari's current value is at about
$75-$125 million.

Later,
Andy

3338. Vietnamese input

Something I would like (but don't need) is a way to input Vietnamese.
I found plenty of good TT fonts (VISCII and VNI encoding) on the web,
but the entire 8bit range is filled with accented roman characters.

I was wondering if something like the COMPOSE.CPX existed for
Vietnamese.

Because of recent international agreements U. S. patents now have
a term of 20 years. This applies to patents currently in force also.
Patents are not renewable after this term. Patent #4000000 was issued in
1976.

I believe most of Atari's patents of any value were prior to the
ST. Maybe I'll look them up!

3340. Atari ST FTP SITES list!!

Newsgroup: comp.sys.atari.st
Date: 1996-02-16 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <3123d7045edb8a1@sn.no>
Source record: 150499

I guess I'll have to try again as sending a message to several groups
at once obviosuly doesn't work (or gets extremely delayed)....

Yes- the Atari ST FTP sites list is back!!! I should have made an
update (well, several in fact), but due to general laziness, having
trouble getting in touch with my partner in the project (Mark Smith-
if you're still out there, send me a note!)..... and a whole lot of
other stupid excuses I haven't posted any new lists for... ages!

But I sort of woke up after having read a posting from someone who was
wondering if there was a list around, and if he should start making
one. I seem to have gotten competition! ;-)

Anyway, here's the latest (er... July 1995) list... I'll try to get
started again making updates, but in order to get the list updated and
correct I need help from you!
I don't have the time, capacity or money (I pay for my online time)
to check every single FTP site prior to each new list etc.

So, if you have any comments regarding the list,
whether it'd be new sites, sites that aren't in use any more,
directory changes etc. then please email me with the details and I'll
use it for the next list.
Enjoy!

Hallvard

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
---
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,

xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available
at your site. If you don't, ask your local system operator how to transfer
files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

This list may by all means be reproduced and distributed freely, but only
with all data intact.

[IDE harddisk interfaces for Atari ST]

>I passed the data along to Dave Troy at Toad. His response was that
>he knew about it, but had no real reason to import it; according to
>him, scsi drives are the same price as ide drives in the US.

That's true, but....

The good old SCSI way:

-SCSI harddisk mechanism
-external case with power supply
-SCSI adaptor or interface ('The Link', 'The Link II', ADsci etc.)

The IDE way:

-IDE harddisk mechanism
-IDE interface

(power can be drawn from the ST's power supply- I've been in touch
with people who have done this successfully).
The IDE and SCSI drives cost about the same, so there aren't really
any savings there.
Moving on to the case with power supply- they're expensive, there's a
significant saving there.

Then there's the SCSI to DMA interface vs. the IDE interface. To my
knowledge the IDE interfaces are cheaper than say a 'Link II'- In
Germany you can get the IDE interfaces for around the equivelant of
US$ 85,-

Now, the IDE interfaces need TOS 2.06 in order to boot, since earlier
TOS versions don't recognize IDE harddisk drives, so I guess you can
add half the price of the external case/power supply there for the
comparison, although it's fully possible to boot from a floppy disk
(though nobody with a harddisk would want to continue using floppy
disks any longer).

But.... as the IDE interface doubles as a TOS-card you save money on
getting one of them if you had intended to upgrade the TOS anyway!
So you be the judge of what's the most effective way to install a
harddisk on your machine.

I've never tried an IDE harddisk on an ST myself (I was actually going
to install one inside my machine, but found out that these interfaces
don't work with STe machine). :-(

I ended up getting hold of a used 'ICD Link II' and a used SCSI harddisk
inside an external case with power supply for my own use.
Apart from saving money on the case/power supply by installing an IDE
drive I felt that having all of it installed *inside* the machine
would be a neater alternative instead of an extra box/cables.
So, there you have it, now you be the judge.

My editor recently lent me a Keyboard Gizmo from Chro-MAGIC to allow me
to use a PC keyboard on my Atari. As my Mega ST's keyboard is slowly
dying (keys are becoming _very_ unresponsive) I figured this'd be ideal.
Problem is, the Keyboard Gizmo's designed to plug into a 1040-type
keyboard connection (i.e. 8 pin) and my Mega's keyboard is a 16-pin.
I've mailed Jim Collins about it, but I havn't recieved a response yet,
so I'm trying here. Anyone know if it's possible to hook this gizmo up
to a Mega ST?

Sounds like you want Kandinsky, you can get it from Hensa, but I can't recall the filename ATM.

Speak to 'ya later!

Text? Not to my standard. I have some text heavy legal documents that are predominantly 10pt with 7pt bold serif and I have to use good ol' GDOS fonts for acceptable quality.

Unhinted calamus fonts just aren't up to it.

Setting the FASTLOAD bit on all the PageStream modules _WILL_ help improve
load times. You gotta set the import/export drivers, printer drivers, etc
not just the main program.

My 14Mb Falcon used to take nearly 2 minutes to load PGS v2.2, it now takes
3 seconds.

AS> Would you say that either Speed of Light or PicSwitch is better than
AS> Gemview?? I have both... so don't want to waste time getting
AS> something which isn't as good! ;-)

Gemview can load and save far more image formats that won't stand a chance in
either of those two, so it's not a case of either/or.

I still keep hold of PicSwitch so that I can convert graphics from the old
Atari 8-bit (KOA and GR9) which nothing else will handle (Gemview or
Imagecopy either!)

Jack Tramiel's "policy" is to do whatever it takes to put money
in his pocket today. He has finally written off letting his son's
mismanage his business and has basically invested what he has left in a
company that might have a future.

No, they closed up about 2 years ago I believe.. I lived for awhile a
couple miles away from them. But, the Version 2 I believe was actually
put out in Europe since they hadn't supported the Atari software
versions in the USA for years..

>stack overflow...

Doesn't like MagiC either - single or multi-tasking mode. This seems like
a major oversight given the way things are going - I mean, if it'll run
under Magic the author can be sure just about anyone can use it, but if it
doesn't run unless you've had to make specific alterations to the set-up
of certain TOS-based computers it's surely asking for trouble.

Personally I'd like to be able to load and configure before activating
STiK. Presumeably this is possible by enabling but not dialling, but
surely the ability to load and have a look around before doing anything
specific would be useful.

I hope I don't sound too negative here. I'm full of admiration for anyone writing software for any computer, particularly TOS-based computers. And I'm most pleased to see a number of people adopting STiK as some kind of a standard and writing applications for it. I hope others with similar skills will be inspired to have a crack at this as well, and will be generous enough to share the results with the world in general. Good luck and keep up the good work. Hope constructive criticism is of help.

Right....now I'm off to reboot and have another crack.....

Well, after further attempts, I've still got nowwhere with this program.

1 - It won't run under MagiC

2 - There's no way to save your download path that I can see

3 - When I'm logged on and I enter a valid ftp address I see the modem sending....just as the program crashes and I'm back to the desktop.

4 - Once back to the desktop and on reloading, attempting to get onto a server again results in a busy bee that won't go away - apparently requiring re-boot to terminate the program.

These are my experiences with the FTP prog. Now I'm sure it must work for some, but not for me. As there appears to be no option selection, no set-up procedure etc., can anyone suggest anything at all?

I'm running a 4meg STE under TOS 1.06.

3359. REVIEW: Computer History (repost)

Newsgroup: comp.sys.atari.st
Date: 1996-02-17 00:00:00 UTC
From: sinbad@airtime.co.uk
Message-ID: <4g5bgq$hh5@neon.airtime.co.uk>
Source record: 150318

A review of...

COMPUTER HISTORY

If, like me, you have been using home computers for the last fifteen years or more, I suspect that you have used many machines along your way to finding the ultimate machine (the Atari ST!).

Personally I have used VIC 20's, Atari 400's, Einsteins, BBCs, Orics and more besides. So the idea of a Computer History package was fairly interesting - a stroll down memory lane I thought.

Computer History comes on three discs. It will only run on an Atari with at least two megabytes - although I am not exactly sure why.

I hope that my pre-release copy was not the final version because booting up disc one took me to the desk top. There were no windows open as if it were a blank disc. This surprised me, maybe I have just got used to STOS-written programs being run from the AUTO folder, as there is no need to load GEM. Maybe I am just being picky?

Once the program is running the main screen gives you a small list of computers. This list is in alphabetical order by computer make and model and is part of a very big list. There are icons to click to roll up and down through the list. A "find" option also exists so you can go straight to a particular computer you wish to obtain information about.

The screen appears a little dull, to say the least but then this is in effect an information database, not supposed to look pretty. Initially only five computers are shown. This seems very odd as there is a massive blank space above and below this list. Using the cursor keys I scroll down a few lines. two dashes signify the "current" selection and four computers are listed before this, plus four after. So now there are 9 computers on the screen, but still a vast area of nothingness. I semi-expected to see the text "this area intentionally left blank".

Scrolling through the list is a little cumbersome. If you leave your finger on the down key too long you'll have a long wait while the list catches up with your request. The screen flickers in a very odd fashion, when you scroll through the list, too. However, like I said, it's a database - not something for an art exhibition.

Using the mouse to control the list is much easier. It is more responsive as much as anything. The search utility is fairly basic. Evidently the search is not case sensitive and searched with each item in the list, rather than making an exact match.

Disappointingly there is no "search next" option. You have to click on find again and retype your text.

Pressing Return or clicking the mouse on the selected item will cause a new screen to appear. I have chosen the IBM AS/400 as I use one of these at work.

Perhaps a bad example as the screen gives me very little information. All that it tells me is that it's name is IBM AS/400 and the notes say it is a Mainframe system. This is not true, our system is a mini-system! So at least the name is correct! No history though.

I exit that screen by clicking on the X (exit) icon. Let's try again - with a better choice, perhaps. I'll search for the Atari. I own an Atari STe so that will do.

Search for Atari...

Not found! What? Okay, because I am in the middle of the list, Atari is at the top and the "search system" cannot scan through the list and back on itself. So how do I get back to the top? I have to scroll back - I think I'll use the mouse! But it still scrolls back one line at a time...

Two minutes and thirteen seconds later I get back to the top of the list. Lucky I was not looking at the Zenith range of computers. This is an area which really needs improvement.

Now I can search for Atari...

I scroll through the extensive list of Atari computers and get to the Atari 520STE. That's the kiddo. Pressing Return gives me a full page of data.

Name: Atari 520STE
Memory: 512k (expandable to ? would have been a nice additional piece of data)
Processor & speed: Motorola 68000 8Mhz
Year released: 1989
Built in software: TOS 1.6/1.62 & GEM desktop
Storage: 3.5" 720k FD
Notes: Replaces STFM with better colours and sound. Blitter chip as standard.

There are a further two icons, one has an eye and the other says "more". Clicking on "more" gives me one and a half pages of details about the Atari STE. There are a few mentions of other computers (namely the STFM, TT and Falcon) - it would have been a nice touch to allow these to be in another colour and clicked on to go straight to information about them.

Clicking on the eye icon gives me a rather good graphic of the STE. It is not a scanned or digitised image but resembles the computer faithfully. By clicking the mouse or pressing space return you the previous screen.

When asked to change disc there is no cancel option so you are forced to dig out the requested disc and insert it. This is most annoying if you have made an error in your selection. There is also a bug in the review copy which

caused the program to terminate. When asked for disc 3 I removed the current disc but lent on the keyboard as I reached for the third disc. I must have pressed Return and the program went back to the desktop.

Similarly when the program starts it requests you to change the disc to disc 2. Pressing enter without a disc in the drive causes Error 48/1070 but at least you are informed and asked to contact technical support. Maybe that happened before but I pressed Return twice. Who knows?

Only two of the three discs contain the database. The first program appears to contain the program and perhaps the list of computers. This, at least, means disc swapping is not as bad as one may first think.

The presentation is sufficient to cater for information retrieval but the user-interface clearly is not. It could be improved with faster scrolling, a more efficient search system and more responsiveness to keyboard presses during scrolling (or less maybe!).

The list of computers is mammoth. With computers from the ABS Orb through to the Zilog MCZ I could find every computer I searched for. the information for each may, however, be minimal depending on the general availability of the information I guess.

I do not know the suggested cost of the package but I would hope that it were under 4 quid. To be honest, if I had been given this as though it were public domain I would not have been surprised. However, if you are after a massive database of computer related information this is it.

Further notes:

The author of the program wishes the following points to be considered:

The program costs 11.99ukp and the reviewed version was the full version. Available from Top Byte.

The keys repeating when scrolling is due to the ST's keyboard buffer. This should be sorted out in the next release.

You can move to the top or bottom of the list using both mouse keys on the arrow buttons. Using the right mouse button you can scroll more rapidly.

The search option will be improved in the next version.

The hard halt caused as a result of swapping discs will need some more testing, although it was thought this had been fixed.

The author was unaware that the AS/400 was a minicomputer.

My suggestion is wait for the next version. Given a good shell (and more reliable data!) this would be a good program.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello everyone,

Can anyone tell me where to get a Tower case for my Falcon?

Can I use a normal PC Tower Case and adapt it for the Falcon??
Any comments will be gratefully received.

Just need some info about what to do and where to go.

Thanx

Nige

Hi Hallvard

Excuse my ignorance, but what is a Katakana font?

BTW I have Fontkit Plus 3, never needed to upgrade to 4, but it's a great program. I used to spend hours tweaking fonts for use with Timeworks :-)
And mine is a legal version as well!

Hi friends: You can use a program called Fast load or pinhead to make
PGS2 load in about 3 to 6 seconds with lots of fonts and drivers.
Make sure that all drivers and PGS program are set to fast load.

You can also do this from the Neodesk or Geneva options.
Click on show info in Neodesk menue and set PGS2 and drivers to fastload.

GDOS ones should be best - at their design size bitmaps will always be best,
followed by TeX's fonts which use a very sophisticated hinting algorithm.

I agree with you that Speedo fonts look very good, better than Truetype
fonts generally and much better than CFNs. But although they hint to
compensate for the low resolution they don't do anything about the
small size - even on a phototypsetter a 5pt font ought to be different
from a scaled down 10pt one.

Whenever I try and open any URL CAB puts up a message saying (I think) 'resolving name' and then just hangs. Anybody know why? I have the NAMESERVER variable set to the address given by my ISP; is thwere any other related variables that need to be set? Thanks in advance.

Nicholas

3367. CAB + NOS?

Hi there,
I want to know the various software packages which can do voice modem protocol. I know about CoMa and CoNnect2, any others - I have a US Robotics Sportster Vi and neither of those run the voice facility.

Thanks

Oops--Where did the SM124 thread go?

John Blackwell <john.blackwell@aspects.com> wrote:
: I'm having what looks like the 1st signs of trouble with my beloved
: Atari mono monitor.

Hello, all:

Maybe this will answer some questions in this thread.

First, the SM124 is not original to Atari. It was used by NCR as a high-resolution mono monitor on its bank machines, before they switched to color monitors. NCR did not build it, and knows nothing about it. It was built by the Asian operations of Goldstar, on a standard TV chassis, using special non-US parts in the sweep circuit, for its high resolution. Goldstar US knows nothing about it. I have talked to both those companies, seeking information, without getting any.

However, Sam's Photofacts and B & C Computervisions have circuit diagrams for the thing, and Best Electronics has the non-US flyback transformer, and the big bipolar capacitor, whose failure often kills the flyback.

The only design deficiency is that the 2.2 uuf bipolar electrolytic capacitor is mounted too close to the heatsink for the horizontal output transistor, and gets gets baked by that heat, leading to early failure. My solution was to replace it with a bundle of plastic dielectric capacitors adding up to the right value, putting long leads on it, and putting it wherever it will fit.

The tube used is long out of production, but replacement electron guns are still available, due to its bank use.

The fading or blooming problem is due to the screen grid voltage drifting upward, when there is little electron beam current to drain off its charge. The fix for this has been adding a resistor between there and ground, or adding a zener diode of the right value between there and ground. This monitor was designed for bank use, not for applications where there is nothing much on the screen.

The lines on the screen are probably a memory problem. Since a program can redefine screen memory if it wants to, it may only happen on some programs. If the chips are socketed, re-seat them. If they are SIMMs, clean their contacts, and put them back in. I

personally have used a mylar film eraser, but do not recommend that to anybody else. Otherwise, get out your parts catalog and your soldering iron, and have at it. There are thorough memory test programs that take about half an hour to run on a four meg machine which will verify if there is indeed a memory problem.

The goo is not leakage (or the monitor would not work at all), it is glue to hold the caps in place until the board was wave-soldered.

Excessive jitter may be due to that capacitor getting sick. I have repaired, and value, several of the things, and all of them have stretched displays, and none of them jitter. The one I am now using has a new electron gun, and a power transformer I rewound because there are no replacements for it, and has been in use for about two years, several hours a day.

Or, maybe, the adjustments are pots, rather than coils, and a shot of contact cleaner and a little wiggle might help.

If that does not help, there is little more that I can offer.

OK, I have tons of stuff to get rid of since it is taking up way too much
room at my house right now...

(1) 1040 ST w/ internal drive
(2) 520 ST's w/no internal drives
(2) SF314's One works, the other?
(1) Custom 2 drive enclosure, one drive works I don't know about the
other

(50+) Games on original disks, some with docs.
(1) Wico joystick
(1) Trackball
(2) random joysticks

Wordperfect for the ST
TOS developers disks
PageStream 2.2 w/100+ fonts and original docs
Lattice C 3.0.4

A non working ICD hardrive interface (not sure what it does, since I
bought it in a big package of other stuff)

Warp9
UIS III
and other random software

I want at least $175 for the three computers, monitors, games, and joysticks

$20 for PageStream

and offers on the rest.

Yeah, right. It's probably as likely to work as asking the whole world to buy
Micro$oft and then force them to make Atari- Amiga- and Archimedes-software.

I've got a better idea: If we all get together and massively buy a Medusa
or a Hades computer we provide enough funds to Mr. F. Aschwanden to found
a new company as powerful as Atari was. Maybe he'll call it Atari-II ?

3374. WWW & Atari...

Newsgroup: comp.sys.atari.st
Date: 1996-02-17 00:00:00 UTC
From: thietavu@news.abo.fi
Message-ID: <4g38ca$mfl@josie.abo.fi>
Source record: 150355

I don't mean to hurt anybody's feelings with this, and neither underestimate the work many people have done this far - so, please, don't get me wrong.

But, I just began to wonder why every other computer platform (Amiga included) seems to have a working Internet/WWW connection system available, and we Atari-users don't ?

Yes, STiK/CAB is there. It just doesn't work in my accelerated, multitasking Falcon - not at all. I can't use it, no matter how much I'd love to. My experiments with MiNTnet have this far also been about disasters... MiNT doesn't like too many of the programs I use daily - and, especially, it doesn't like Falcon & Geneva OS & Blow-Up screen enhancer at all. Trouble! A lot of it.

What puzzles me, is this: virtually everything works great in this system: Calamus, music stuff, even games. So, this Falcon is stable, fast, and works extremely well. Telecommunications software like CoNnect runs perfectly and fast. Why wouldn't a WWW browser work in an accelerated, modern Atari-compatible computer as well? And why can't I find _anything_ I could use for WWW?

Is it technically more difficult to build a Slip/ppp/www system for Atari-compatibles than for e.g. Amiga? What is the reason we alone in computer world have trouble getting even one www-browser working? I'd like to hear more about this from you there who have the knowledge.

AFAIK, one problem is the lack of color, CPU power and multitasking in many older STs. TT and Falcon would do better here, but are there so few TT/Falcon/etc -users around that nobody's really interested in creating serious Internet software for them? MiNTnet is probably fine, but I doubt it can be made compatible and easy enough for the majority of Atari-users.

As there are lots of brilliant Atari programs around, and new ones come out constantly, I hope we'll be able to surf the chaos of Web in near future. Please, hurry up - you there, who have the skills! The first fully reliable WWW-browser _will_ be a hit in Atari community =) ! Perhaps CAB will be the one, soon?

Greetings,
Tommi (surfing with LYNX isn't much fun, after all ;-)

: Write are excellent writing tools (with some reservations), and can handle
: some simple DTP, but what we want is a proper DTP program.

I agree fully on that! We'd have a perfect moment to have a new
DTP-system available, supporting all the newer Atari features.
Well, there _is_ one coming out! IIRC, Adequate Systems (related to
Calamus SL) in Germany are making a new multi-platform DTP system.
I wish I knew more... But that firm _really_ knows what they are doing!

: the adjustable guidelines, text rotation, etc etc. There's nothing wrong
: with Calamus except lack of hinted fonts which make output at point sizes
: below 14 point pretty awful on 300 DPI printers.

Well, I must disagree here ;-). I think, Calamus creates excellent
results in 300 and 600 DPi. As good as anything I've ever seen on any
platform, and far better than most PC/Mac solutions I've used.

In 150..240 dpi, dot-matrix printers, and perhaps, low-quality inkjets,
you are probably right: Calamus isn't for them.

Cheers,
Tommi:

The MSTE *should* be able to connect - but Atari shipped a fair few into the UK with the wrong TV modulator. Using these machines with a TV was impractical due to the amount of snow and picture distortion.

MSTEs like this should have a green and white warning lable on the back.

If Magic was written for the German and English speaking people, i'm
sure this problem would never have arrived.
So in my opinion, all software for the Atari should be in *both*
english and German, simply because it seems like these two languages are
"the ones" on the Atari platform.
It would be waste of time writing frence or anythinge else language, as
it's small markets, and those markets understand either german or english
just fine.
Another point is, if you want a market in a another country, you write
the software in their language. It would be stupid to release a frence
version of some software in scandinavia, and visa versa.

Where the heck is Magic4 UK then ?

3379. Monitors for sale: NEC 3D and Atari color

Newsgroup: comp.sys.atari.st
Date: 1996-02-17 00:00:00 UTC
From: caruso@best.com
Message-ID: <4g5mvd$neq@shellx.best.com>
Source record: 150360
Cross-posted to: ba.market.computers,comp.sys.atari.st

Two monitors for sale:

1. NEC 3D monitor. Excellent condition. $150

(Great 3-in-1 monitor for Atari ST/STE low, medium, and high resolutions with switchbox and 5-in-1 monitor for Atari TT and Falcon.).

2. Atari SC1435. Excellent condition. Stereo (sound), color monitor. $150.

I'd prefer to deliver in the Bay Area (instead of shipping them nationwide).

Prices listed, or best offer. If interested, please send e-mail to caruso@best.com or ekrimen@macromedia.com.

Thanks!

The other method is to just hit the d key this will then give you the
option to download via z-modem or to your home shell. This works with any
file including text files. You use the d-key instead of return or the
right arrow.

In a message of <14.02.96>, Sanjay Parker (2:200/427.1) writes:
SP> 1) Will CAF run in accelerated modes?

I run my Falcon with a SpeedResolution card and Cubase Audio works in both 32 and 36MHz. I haven't dared trying 40MHz, because the user manual says that some Falcons have trouble with the SCSI-port at 20MHz bus-speed (the bus speed is always half of the CPU speed with SpeedResolution) and I don't dare risking anything with my already recorded audio...
I haven't tested the FX-card, but since CAF works perfectly with my accellerator it would surprise me very much if it didn't work with FX.

SP> 2) Can CAF use Fast Ram for its RAM tracks?

No, but the program itself can be loaded into FastRAM and your original 4MB of ST-RAM can be used for samples, if the info I've got is correct. Only ST-RAM can be used for RAM- and Sampler tracks according to my source (at least in the current version, which is 2.04).

SP> 3) Will CAF ever be in color?

Probably not, because color modes make the Falcon work much slower and with CAF it's really pushed to the limit already.

Best regards,

Claes

GS> know is how the inductor and the capaciter are
GS> labeled/located.

Hi George,
I've had prolems some time ago with a completely dead keyboard in a Falcon and that time it was because of a broken layout line in a middle layer of the PCB and the signals didn't get thru. This could be the case with yours too, only that the circuit line hasn't been completely cut off yet. If I were you, I'd settle for the connection you've already made, since if it's a broken layout there could be a thin crack in the PCB, which can get bigger and cut more lines if you handle the PCB too heavily. On the board I repaired this crack was located close to the keyboard connector and I was able to see it by holding the board towards a lamp, so I could bypass it by locating suitable connections close to the connector.

Best regards,

Claes

bk> alot. Realisticly, just how much space can I expect to use up
bk> for HD recording? (If it matters, mainly I will be recording
bk> voice and brass instruments.)

Hi Keith,
Congratulations on your choise!
I've used my Falcon with Cubase Audio for over a year now and I'm very pleased with it. After this letter you'll find some info I've put together...
You'll use about 5MB per audio track per minute, so a song with constant use of 8 tracks and of 4 minutes length uses about 160MB on your HD (which must be a SCSI-II hard disk).
Any other specific questions? Just ask away and I'll do my best to answer.

Best regards,

Claes

Problems with clicks in your recordings with Cubase Audio for Falcon?

After fax exchanges with Atari in the Netherlands, discussions with the Swedish distributor of Cubase - Fitzpatrick Import Group, other cunning persons and various experiments of my own, I can now, with great certainty, say that I have all the facts to make shure there is never another click in the recordings.

* The CPU clock has to be modified because the clock pulses aren't clean enough and Cubase Audio is very sensitive to flaws in the hardware (any little error and the program won't work properly, it seems). Two different modifications are provided but regretfully there is no way of telling which one to do - if the

first one doesn't work, the other one will. Always start with modification number one. The Falcon machines that are delivered at present have been modified from the start.

* When using HDX/AHDI a maximum of 256MB partitions is allowed on the hard disk or it won't work as it should. When using SCSItools from Hard&Soft it also works fine with partitions up to 511.9 MB. When partitioning in SCSItools the Sector size has to be adjusted to 8192 bytes and the Partition size to a maximum of 65532 sectors (I don't know why I wasn't able to go up to 512 MB, but 511.9 worked fine). In HDX these parameters can't be adjusted -partitions of more than 256 MB automatically get a Sector size of 16384 bytes, which doesn't work at all with Cubase Audio - the program simply says that it's impossible to record on the drive. I can also tell you that with a Conner 1 GB, I get a transfer of 1.3 MB/s with AHDI and 1.8 MB/s with SCSItools (SCSItools gives me a transfer rate with my 850 MB Conner EIDE of almost 3 MB/s !!!). For some strange reason, Atari have limited the SCSI-II port to 2 MB/s, but it's enough to be able to make audio recordings, so don't worry.

* A fast hard drive is essential, as well as a NON CALIBRATING drive. If the drive calibrates during playback or recording everything stops, since Cubase can't access the drive fast enough to maintain the data flow, so it's impossible to work with a calibrating hard drive. To run 8 tracks from the hard drive it seems that a seek rate of around 11ms is a maximum (most 1 GB drives manage this). It's possible to use slower drives as well, if the recordings are located on different drives (different PHYSICAL hard drives, not only different partitions). Another possibility is to use the RAM-tracks to get some load off the drive - that is, if enough RAM is available (I recommend 16 MB RAM).

* DEFRAGMENT!!! If the hard drive is fragmented (which it will become if you erase, clip and record over again), the playback / recording gets slower, since the drive heads have to seek over larger areas to get the recordings together - compared to what it is like when the recordings lie in a nice, long unbroken file. If recordings have been made to a fragmented drive and clicks have occured because of this, there is only one way of getting it right -make a new recording. I strongly advice everyone to buy Diamond Edge from HiSoft/Oregon Research - it's the best defragmentation program that I know of and the one I use.

* Always update the program (at the moment it's version 2.04). Cubase Audio gets updated all the time, with some small improvements and some bug fixes. With a program as advanced as Cubase Audio, it's always best to have the latest version.

If these steps are taken, there doesn't remain any possibility of getting clicks in the recordings. The last point is not of importance for the click problem since it's caused by circumstances outside of the program, but it's always best to have the latest one.
The clock modification should be covered by the warranty (it is here in Sweden, anyway) and made by your service center. However, if the warranty has run out you can do the modification yourself (DON'T if you aren't very experienced with a soldering pen and surface mounted components - I've seen terrible examples of soldering and if you're not 200% certain that you can do it, DON'T). I can send

the schematics for these modifications if you request it by sending a mail to me.

In most cases it's best to disable all software hard disk caches, since Cubase handles the reading/writing in it's own way and extra caches may interfere with the main program.

SCSI drives I have tested myself are: Conner CFP1060S (1.06 GB), Conner CFP1080S (1.08 GB), Conner CFP2107S (2.1 GB), Conner CFP2105S (2.1 GB), Seagate ST31200 (1GB). The CFP1080S has a problem with timestretching, but the regular recording works perfectly.

I use one CFP1060S and one CFP2105S in my recording studio.

Good luck and best regards,

Claes Holmerup, service engineer at Micro Rescource Data AB in Malmoe, Sweden (as well as Cubase Audio user).

3384. Broken Mega STe

Newsgroup: comp.sys.atari.st
Date: 1996-02-17 00:00:00 UTC
From: HQBA73D@prodigy.com
Message-ID: <4g3jcg$vo8@usenetw1.news.prodigy.com>
Source record: 150365

Allright guys, my Mega STe is broken and I can't figure out exactly what's wrong with it. The power light turns on and everything.....It has something to do with the disk drive, which I just barely bought a new one, and the haard drive doesn't work. I just gives me the "Drive A: is not responding." [cancel] [retry] It's really annoying. I have the Ajax chip and Tos 2.06 and the new drive is a HD. I was also wondering which order the power supply cords are supposed to go into the connector, because me being the dumbshit that I am took them out for some odd reason and I don't know which order they go back in. I think that might be the problem.....

Please Help if you can.

JASON HANSEN HQBA73D@prodigy.com

3385. Re: StiK ftp works :)

Newsgroup: comp.sys.atari.st
Date: 1996-02-17 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <4g3na5$jn3@madeline.INS.CWRU.Edu>
Source record: 150366

HOW did you get it working? What was your magic key?
I downloaded it, and put it into my ST, unlzh'd it.
I translated the German README with ruftrade, and it had no
instructions. Soooo---, I simply changed the man□□□
name mg-ftp<<_e.rsc to mg-ftp.rsc, as it appears to want,
and dialed up stik. Now STiK USUALLY works fine for me,
in CAB or Telnet mode. It still works fine in those modes.
BUT, when I loaded mg-ftp, I had problems.
1. I gave it the host name of my VAX at the laboratory.
That is □, I gave it a partial name. (the real name is
cwbdc.chem.cwru.edu. I gave it cwbdc.cwru.edu which
is a partial name, but my resolver decoded it properly.)
I then clicked on "OPEN", it gave me a dialog box, with places for
my login name and for my password, which I filled in properly.
It chugged away for a while, and I could see SD and RD lights
blinking. The dialog box went away, and I had GARBAGE on the screen.
Orderly garbage for sure, but garbage nonetheless.
I quit, and retried to open ftp.uni-giessen.de, but it came
back with an alert box, saying it couldn't resolve the address.
2.
I tried several more times, to access other ftp sites, but no luck!!
The last couple of times I tried to open my VAX, I couldn't
even get the garbage screen. It hung for minutes during the open sequence.
Until I finally gave up and rebooted.
3. Now I KNOW my VAX is working, and it can receive FTP from
my PC over the same fiber optic line at the Univ. I have never
tried FTP TO the VAX from off campus, but it can FTP out.
I know ftp.uni-giessen.de works and the campus resolver
understands it cause I have downloaded from it with LYNX and FTP
on the VAX.
4. I know the Univ slip line works fine cause I use it for
CAB often.
I just know there is going to be a lot of traffic in csas
for the next week or so, till this gets ironed out, but for now
HHHHHEEEEELLLLLPPPPP!!!!!

My apologies to everyoe. I was under the mistaken impression that the Atari's printer port was an "outie" only. I've been programming the damn things for ten years, and this is the first time I've found out about it.

As to whether the Snappy can be used, that remains to be seen. My suspicion is that it is not compatible because of the PC's way of doing things.

HYBRID ARTS doesn't exist. They sold to Barefoot Software, who did little for a great product. They then sold to Binary Sounds, who also seem to have done little more than sell old stock. They may still exist, though a friend of mine, who was supposed to become their Australian distributor, never received any stock, and hasn't been able to contact them by phone recently. AFAIK, 1.1 was the last version of EZ-Score. Initially, there was to be a 60 stave version to go with EZ-Track etc., but it never happened. Good luck in tracking them down- if you do, let me know.

3391. new magazine proposal: alt.computing.alt. opinions

Newsgroup: comp.sys.atari.st
Date: 1996-02-17 00:00:00 UTC
From: tsyklon@aol.com
Message-ID: <4g3ug1$j2e@newsbf02.news.aol.com>
Source record: 150372

I am currently working with my company's publishing department to produce a magazine called "alt.computing.alt" and I want to get your reaction to the idea.

a.c.a will be a high-quality, glossy magazine with approx. 250 pages covering the area of alternative computing. That is to say... the magazine caters to those with alternative platforms to MS Operating systems. The magazine will cover the following areas: 8-bit (Apple II, Commodore 64/128 etc., 16-bit (Atari ST, early Mac etc.) , 32-bit (Amiga, Later Atari, Mac II etc.) and high-end work stations like Sun Sparc/ SGI, NeXT etc.

OS' would include (but is not limited to): MacOS, AmigaOS, All Unix types, OS/2, acorn, TOS and any OS alternative to MS type systems.

My team's goal is to make this magazine fuel another hardware war like we enjoyed in the 80's. (Remember when companies like Broderbund or Sierra made 10 computer versions of every game?) It might just give the alternate platforms a chance. A.c.a would serve as huge clearinghouse for information and advertising on these niche markets. It would help legitimize them.

Whether you are a PC/Win user or anything else, it is conventional wisdom and that a free marketplace of ideas is essential to innovation. We all know that in capitalism... it is dangerous for any one type of a product to dominate.

We'd also make certain there would be WWW support for late-breaking news, etc.

So... what do you think? Will it fly folks? How much would you pay for a quality mag of this type? (UK, Deutsch, US, AUS, Canada currency)

Any suggestions or input would be most welcom.

Thank you.

You need a 2.5" to 3.5" wired IDE-Adapter (Kable)
Got it by TOAD ;-)

Don't use the +12V fom the internal Falcon PowerSupply!!!
Falcons PS only have +5 VDC / 3.5 A
+12 VDC / 200 mA (FAN ONLY)

You need a extra PowerSuplly for your 3.5" Drive..
2.5" only need +5VDC !

As I've said before, Mike, I agree with all that. Something that's capable
of more than the basic elements that Timeworks has, but isn't as distant from
people's pockets as DA's Layout would be much appreciated around these parts..

I'm in the middle it seems. Vitually all the time Cab and Magic 2.0
work fine together but on the odd occasions it persistently crashes on
the same byte count whilst fetching something it can be persuaded to
work by turning pre-emptive multitasking off.

A similar problem occurs with the irc program. I get long periods of
"lockups" where the modem SD light is on and nothing else happens.
This can be made to go away by turning pre-emptive multitasking off as
well.

I suspect STiK has a code section that should be running in supervisor
mode.

Hi Roger

I didn't translate the docs that much, and I only printed out one page
TBH :)

It will be a tragedy if the word count is not included, a terrible
omission. Let's hope we just haven't spotted it yet ;)

>you are probably right: Calamus isn't for them.

I use a 300 DPI LJ4L with resolution enhancement, but I still don't think Calamus at small point sizes beats Speedo or even good GDOS fonts at the same sizes. Though once you go above 14 point, the CFN quality is fine.

I have used all sorts of CFN fonts, including some *commercial* quality ones, and I still think they are not so good. But, you probably have some better ones and can get better output. I did think I would see a big improvement when I went from a DJ500 to the LJ4L, but there was hardly any difference IMO.

To my mind, the biggest problem with many CFN fonts is their poor kerning. I used to spend hours manually kerning my text just to get a decent look. But I find that Speedo and GDOS fonts don't need anything like as much kerning to make them look better. Just the occasional pairs, or when the point size is very big :-)

Anyway, I still use Calamus a lot, and I like the program, so I guess it's a case of "horses for courses" this time :-) And one very important fact is that CFNs are easier and a lot cheaper to obtain than Speedo fonts ;-)

BTW, has anyone ever thought it possible to write a program that can use CFN and GDOS fonts together in a DTP environment? I know that some art programs can use them together (Textstyle and EC Paint), but they just write to the screen, as opposed to their *proper* use :-)

>
>Greetings,

I have got to agree on this point. I have tried and tried to get CAB working online but never got past the resolving host message. It probably is my set up, but I have done it just like the docs/articles say, but no success. Offline CAB is just great, but I too miss being able to surf the web. Unlike some, I don't have access to any other computer than my own, so I feel well and truly out of it all :-(

Let's hope that someone comes up with a easy-to-set-up working WWW program for the ST/Falcon soon. I'd even buy it at commercial prices if I knew it worked well :-)

Any German driver should do, even older ones. If you want to make use of the
ZIP drives write/read protection features, you have to use the current
version of HDDRIVER. (ftp://acp5.chemie.uni-kl.de/pub/atari/)

Arbitrary sizes.
BTW, BIGDOS is no program especially written for ZIP drives. TOS won't be able to use DOS formatted partitions > 32 MByte regardless of the drive type. The 32 MByte limit results in incompatibilities between DOS and TOS and these incompatibilities exist with hard disk drives as well as with ZIP drives.

3407. REVIEW: Computer History

Newsgroup: comp.sys.atari.st
Date: 1996-02-17 00:00:00 UTC
From: sinbad@airtime.co.uk
Message-ID: <4g4evf$asf@neon.airtime.co.uk>
Source record: 150388

A review of...

COMPUTER HISTORY

If, like me, you have been using home computers for the last fifteen years
or more, I suspect that you have used many machines along your way to finding
the ultimate machine (the Atari ST!).

Personally I have used VIC 20's, Atari 400's, Einsteins, BBCs, Orics and more
besides. So the idea of a Computer History package was fairly interesting - a
stroll down memory lane I thought.

Computer History comes on three discs. It will only run on an Atari with at
least two megabytes - although I am not exactly sure why.

I hope that my pre-release copy was not the final version because booting up
disc one took me to the desk top. There were no windows open as if it were
a blank disc. This surprised me, maybe I have just got used to STOS-written
programs being run from the AUTO folder, as there is no need to load GEM.
Maybe I am just being picky?

Once the program is running the main screen gives you a small list of computers.
This list is in alphabetical order by computer make and model and is part
of a very big list. There are icons to click to roll up and down through
the list. A "find" option also exists so you can go straight to a particular
computer you wish to obtain information about.

The screen appears a little dull, to say the least but then this is in effect
an information database, not supposed to look pretty. Initially only five
computers are shown. This seems very odd as there is a massive blank space

above and below this list. Using the cursor keys I scroll down a few lines.
two dashes signify the "current" selection and four computers are listed
before this, plus four after. So now there are 9 computers on the screen, but
still a vast area of nothingness. I semi-expected to see the text "this area
intentionally left blank".

Scrolling through the list is a little cumbersome. If you leave your finger
on the down key too long you'll have a long wait while the list catches up
with your request. The screen flickers in a very odd fashion, when you scroll
through the list, too. However, like I said, it's a database - not something
for an art exhibition.

Using the mouse to control the list is much easier. It is more responsive
as much as anything. The search utility is fairly basic. Evidently the
search is not case sensitive and searched with each item in the list,
rather than making an exact match.

Disappointingly there is no "search next" option. You have to click on
find again and retype your text.

Pressing Return or clicking the mouse on the selected item will cause a new
screen to appear. I have chosen the IBM AS/400 as I use one of these at
work.

Perhaps a bad example as the screen gives me very little information. All
that it tells me is that it's name is IBM AS/400 and the notes say it is
a Mainframe system. This is not true, our system is a mini-system! So at
least the name is correct! No history though.

I exit that screen by clicking on the X (exit) icon. Let's try again - with
a better choice, perhaps. I'll search for the Atari. I own an Atari STe so
that will do.

Search for Atari...

Not found! What? Okay, because I am in the middle of the list, Atari is at

the top and the "search system" cannot scan through the list and back on itself. So how do I get back to the top? I have to scroll back - I think
I'll use the mouse! But it still scrolls back one line at a time...

Two minutes and thirteen seconds later I get back to the top of the list.
Lucky I was not looking at the Zenith range of computers. This is an area
which really needs improvement.

Now I can search for Atari...

I scroll through the extensive list of Atari computers and get to the Atari 520STE. That's the kiddo. Pressing Return gives me a full page of
data.

Name: Atari 520STE
Memory: 512k (expandable to ? would have been a nice additional piece of
data)
Processor & speed: Motorola 68000 8Mhz
Year released: 1989
Built in software: TOS 1.6/1.62 & GEM desktop
Storage: 3.5" 720k FD
Notes: Replaces STFM with better colours and sound. Blitter chip as standard.

There are a further two icons, one has an eye and the other says "more".
Clicking on "more" gives me one and a half pages of details about the Atari STE. There are a few mentions of other computers (namely the STFM,
TT and Falcon) - it would have been a nice touch to allow these to be in another colour and clicked on to go straight to information about them.

Clicking on the eye icon gives me a rather good graphic of the STE. It is not
a scanned or digitised image but resembles the computer faithfully. By clicking the mouse or pressing space return you the previous screen.

When asked to change disc there is no cancel option so you are forced to dig
out the requested disc and insert it. This is most annoying if you have made
an error in your selection. There is also a bug in the review copy which
caused the program to terminate. When asked for disc 3 I removed the current disc but lent on the keyboard as I reached for the third disc. I

must have pressed Return and the program went back to the desktop.

Similarly when the program starts it requests you to change the disc to
disc 2. Pressing enter without a disc in the drive causes Error 48/1070
but at least you are informed and asked to contact technical support.
Maybe that happened before but I pressed Return twice. Who knows?

Only two of the three discs contain the database. The first program
appears to contain the program and perhaps the list of computers.
This, at least, means disc swapping is not as bad as one may first
think.

The presentation is sufficient to cater for information retrieval but the
user-interface clearly is not. It could be improved with faster scrolling,
a more efficient search system and more responsiveness to keyboard presses
during scrolling (or less maybe!).

The list of computers is mammoth. With computers from the ABS Orb through
to the Zilog MCZ I could find every computer I searched for. the information
for each may, however, be minimal depending on the general availability of
the information I guess.

I do not know the suggested cost of the package but I would hope that it were
under 4 quid. To be honest, if I had been given this as though it were public
domain I would not have been surprised. However, if you are after a massive
database of computer related information this is it.

Further notes:

The author of the program wishes the following points to be considered:

The program costs 11.99ukp and the reviewed version was the full
version. Available from Top Byte.

The keys repeating when scrolling is due to the ST's keyboard buffer. This
should be sorted out in the next release.

You can move to the top or bottom of the list using both mouse keys on the
arrow buttons. Using the right mouse button you can scroll more

rapidly.

The search option will be improved in the next version.

The hard halt caused as a result of swapping discs will need some more testing, although it was thought this had been fixed.

The author was unaware that the AS/400 was a minicomputer.

My suggestion is wait for the next version. Given a good shell (and more
reliable data!) this would be a good program.

Martin

Coldfire isn't a processor as such (I've got the docs). It's an embedded core
that you can stick on an ASIC for integration with other things. So, you'd
put your MPEG decoder, your blitter and your CPU all onto one chip. It isn't
available as a stand alone chip at all - and never will be. As to it's
speed....well, I think your lectureer is thinking of a different Motorola
CPU core - the Coldfire core gives you performance in between an 040 and an
060. Very good, and quite able to compete with the ARM core that is widely
used at the moment - but not a competitor for dedicated RISC CPU's like
the StrongARM (DEC/ARM) or MIPS (or even the faster UltraSparc's).

> was wondering about that GE-Soft Eagle machine, with its flexible bus system. Isn't
> that supposedly able to accomodate *any* processor you care to throw at it? (With
> appropriate host card...) I seem to remember an interview with the designers, in which
> they mentioned that PPC and Pentium CPUs could be used, with the right adaptor
> board... Any thoughts??

It's theoretically possible. The Acorn RiscPC does it (runs ARM and
486/Pentium processors at them same time - and lets you run RiscOS &
Windows simulateneously, with windows from both on screen at once).

Craig.

Hi Harry and all Atari DTP-ers

Now that I have had a chance to play with the German demo of Papyrus 4, I can see it's not going to be a huge improvement over Papyrus 3. But that's only because I was looking for a more DTP-orientated program. As a WP it is excellent, assuming of course that there is a word count in the final version :-)

The likes of DA's Layout are much too expensive for most people. I have never had a play with the program, or even got a demo of it, so I can't comment too much. Perhaps someone can tell me a bit more about it?

Timeworks is easy to use, and has many good features. But the Speedo incarnation is based upon a very old program that simply doesn't have the facilities needed by most semi-professional DTP people like me. I love the program because of its ease-of-use, but I get frustrated by its short-comings.

Some will say, "Why doesn't he get a Mac?", but I don't want to desert the Atari, and apart from which I don't have the money to buy a new system plus all the software I would need. The ST/Falcon/clones now have an excellent font system in the shape of SpeedoGDOS/NVDI, so all we really need is a program to take advantage of it. There are now various drawing programs making full use of Speedo, so even though I am not a programmer, I am sure that writing a dedicated mid-to-top-end DTP program would be feasible.

I have, BTW, bought the vector version of Easy Text Professional, but although there are some nice features in the program. Its screen redraws,

which take an eternity, and general slowness, and unreliability in certain areas made using the program a nightmare. It's great if you just want to design a simple one page document IMHO, but trying to do a 40 page monthly magazine like I need to do is not on. There's no hypenation facility at all, which more-or-less counts it out for professional use, though some purists will say that hypenation should never be used, and text should not be justified anyway:-)

Our friend Tommi in Finland tells us that he is aware of a German company that are writing a multi-platform DTP program, which if correct, is encouraging. The only problem is that will it ever be translated into English? The authors would have to be certain that there would be a market for such a program if it was translated. Perhaps, if we can find out some more, then all of us that want such a program can send messages of encouragement? :-)

With the withdrawal of Atari from our market, no software company can afford to write a major program for the ST/Falcon nowadays unless they know there will be a good chance of getting the R&D costs and production costs back along with some profit. Therefore, I think it vital that as many people make it known that they are interested in certain programs and communicate their thoughts to the companies concerned. This goes for many other types of program as well, not just DTP. That way we might see some of the excellent German (and other nationality) programs get translated into English.

Anyway, I've rambled enough for now. Anyone got any thoughts/ideas on Speedo DTP?

Sounds interesting, and if anyone can help stop or delay Bill Door's march
to world domination, they've got my support!

Assuming that there were around 30 to 40 pages an issue devoted to TOS
news/features plus general stuff, I'd pay GBP 4.00 an issue plus if mag was
going to be posted, another GBP 1.00.

>or .acc that you can run which will change the screen resolution for you
>without having to re-boot the whole system?? :|
>
I'm not sure about doing it in STOS, what you need is to make an XBIOS
call:

~XBIOS(%,l:-,l:-1,0)
^
one percent sign there !

the above changes to low res, (thats the zero)

...l:-1,l:-1,1) changes to med
and .....,l:-1,2) changes to high res (with a reset !)

however even if you can do this, it really messes up, drawing using
GEM, and dialogs, fileselectors, or drawing (inc. pixel tests) can be
messed up !!!

3422. Re: new magazine proposal: alt.computing.alt. opinions

Newsgroup: comp.sys.atari.st
Date: 1996-02-17 00:00:00 UTC
From: jnorton@ra
Message-ID: <4g51ct$b7u@thoth.nilenet.com>
Source record: 150403

Better call it "Classic Computers". I would think that it would be
difficult to sell a magazine with such a broad scope. I enjoy reading my
Atari magazines (from cover to cover). I am not sure that I would enjoy
only understanding or practically benefiting from only 1/8 of a magazine.
Call me "Realistic from Colorado".

Tsyklon (tsyklon@aol.com) wrote:
: I am currently working with my company's publishing department to produce
: a magazine called "alt.computing.alt" and I want to get your reaction to
: the idea.

: a.c.a will be a high-quality, glossy magazine with approx. 250 pages
: covering the area of alternative computing. That is to say... the
: magazine caters to those with alternative platforms to MS Operating
: systems. The magazine will cover the following areas: 8-bit (Apple II,
: Commodore 64/128 etc., 16-bit (Atari ST, early Mac etc.) , 32-bit (Amiga,
: Later Atari, Mac II etc.) and high-end work stations like Sun Sparc/ SGI,
: NeXT etc.

: OS' would include (but is not limited to): MacOS, AmigaOS, All Unix types,
: OS/2, acorn, TOS and any OS alternative to MS type systems.

: My team's goal is to make this magazine fuel another hardware war like we
: enjoyed in the 80's. (Remember when companies like Broderbund or Sierra
: made 10 computer versions of every game?) It might just give the
: alternate platforms a chance. A.c.a would serve as huge clearinghouse for
: information and advertising on these niche markets. It would help
: legitimize them.

: Whether you are a PC/Win user or anything else, it is conventional wisdom
: and that a free marketplace of ideas is essential to innovation. We all
: know that in capitalism... it is dangerous for any one type of a product
: to dominate.

: We'd also make certain there would be WWW support for late-breaking news,
: etc.

: So... what do you think? Will it fly folks? How much would you pay for a
: quality mag of this type? (UK, Deutsch, US, AUS, Canada currency)

: Any suggestions or input would be most welcom.

: Thank you.

3423. Re: ATARI up for sale? Why not buy it?

Newsgroup: comp.sys.atari.st
Date: 1996-02-17 00:00:00 UTC
From: BobR <76702.1466@CompuServe.COM>
Message-ID: <4g3in6gru1@mhafn.production.compuserve.com>
Source record: 150450
Cross-posted to: rec.games.video.atari,rec.games.video.misc,misc.invest.stocks,comp.sys.atari.st,comp.sys.atari.advocacy

Assets Atari has..?

Plant... virtually nothing. They sold off their Taiwan manufacturing plants years ago so they could make the annual reports look a little better, balancing it off against the normal yearly losses.

Machinery.. nothing. The Jaguar was originally built by IBM in its own plants. It is now built (that is, when they ARE being built) by another, smaller company. Cartridge manufacturing is farmed out to third party manufacturers.

Stock... reports say there are 85,000 Jaguars in warehouses. Value depends on how much you figure you could sell them for.

Good will..? ummm... next..!

Patents... about the only thing of tangible value left, mostly grandfathered from Warner Communications Atari Inc. Suing other companies over patent violations may be the most lucrative thing Atari can do now.

Name recognition..? In the mid-80s, Jack Tramiel said the only thing of value he wanted from Atari, Inc. was the Atari name. Now, in the mid-90s, even that is probably not worth very much.

3427. Problems with STIK/CAB

Newsgroup: comp.sys.atari.st
Date: 1996-02-18 00:00:00 UTC
From: smiller@farad.elee.calpoly.edu
Message-ID: <4g6ln9$eac@isnews.csc.calpoly.edu>
Source record: 150254

OK, when I use STIK I do not use the autodial part, I login to my system using STalker and I type the commands to enable a SLIP connection then I go into STIK after closing the STalker window and I set my IP address as was given to me during my login process. I then go into CAB, open a URL and it just says : "Resolving Host" and nothing ever happens except for a blip every few seconds on my Send Data light on my modem.

I did have to set the MTU size to 1500... it says that when I login.

I know I have the DNS address right, I got it from my sysadmin... what's going wrong?

I have a TT with a USR Sportster 14.4 and I am operating on Serial 1.
DO I need HS Modem or something? What is HS Modem anyway?

HELP! I would really like to get the freakin' thing working!

thanks :)

3429. Q: irpnII demo probs

Newsgroup: comp.sys.atari.st
Date: 1996-02-18 00:00:00 UTC
From: a1960563@athena.rrz.Uni-Koeln.DE
Message-ID: <4g75al$22m@news.rrz.uni-koeln.de>
Source record: 150256

Hi everybody,

I installed a demo version of irpn II for accelerating the output of data at the centronics port. Now I realised some strange phenomenons obviously caused by irpn II.
After starting a printout the "bee" seems to be caught by some sort of "tractor beam" and refuses while printing to come out of the upper left edge of monitor.
Afterwards my harddisk goes crazy and the opened window opens again and again twice or three times per second until you close it with the flickering mouse symbol.
After shutdown and rebooting the system works alright until you start another printout - and there it is again! :-((

I tested the whole thing with irpn II inactivated and those strange misbehaviours were gone. So the criminal seems to be irpn II.

Is this typical for the demo version or can this happen with a registered version as well?

I've got a TT with MagiC3 and Ease installed (and the oldfashioned but reliable AHDI 6.061). For printing I only use the GDOS-System for my HP Laserjet.

Anybody out there with similar experiences or ideas what to do about it? It's a pity, without irpn II the printing really needs some time!

CU,

Kerstin

Source record: 150257

Tommi Hietavuo TKKK (thietavu@news.abo.fi) wrote:

: Yes, STiK/CAB is there. It just doesn't work in my accelerated,
: multitasking Falcon - not at all. I can't use it, no matter how
: much I'd love to. My experiments with MiNTnet have this far also
: been about disasters... MiNT doesn't like too many of the programs
: I use daily - and, especially, it doesn't like Falcon & Geneva OS
: & Blow-Up screen enhancer at all. Trouble! A lot of it.

Don't blame MiNT for Geneva's poor ferformance under MiNT... And BlowUp works fine with MiNT, although I've had some problems with an old Hard1-version of this software.

:
: What puzzles me, is this: virtually everything works great in this
: system: Calamus, music stuff, even games. So, this Falcon is stable,
: fast, and works extremely well. Telecommunications software like
: CoNnect runs perfectly and fast. Why wouldn't a WWW browser work
: in an accelerated, modern Atari-compatible computer as well?
: And why can't I find _anything_ I could use for WWW?

I'm running MiNT 1.12, MiNTnet and MultiTOS on my 14Mb/36MHz Falcon, and it's very stable, including CAB.

: Is it technically more difficult to build a Slip/ppp/www system
: for Atari-compatibles than for e.g. Amiga? What is the reason
: we alone in computer world have trouble getting even one www-
: browser working? I'd like to hear more about this from you
: there who have the knowledge.

Well, the AmigaOS is actually some sort of unix-clone, and AmiTCP (The networking software for Amiga) is a unix-port. Much like MiNT/MiNTnet actually :-) And the only Amiga browser I've seen (AMosaic) is a crappy piece of software, not nearly as slick and fast as CAB.

: AFAIK, one problem is the lack of color, CPU power and multitasking
: in many older STs. TT and Falcon would do better here, but are there
: so few TT/Falcon/etc -users around that nobody's really interested
: in creating serious Internet software for them? MiNTnet is probably
: fine, but I doubt it can be made compatible and easy enough for the
: majority of Atari-users.

As long as you have a harddisk and 4Mb RAM, MiNT/MiNTnet will perform fine on all Ataris. You can't expect to get decent networking software, GEM-based Web-browser/ftp/telnet without a harddisk. Look at the Amiga, Mac or PC, none of them will do this. Actually, STiK/CAB is the only "proper" Internet-software I've seen that will work on a computer with no harddisk, 1Mb RAM and a TV...

A pity it's unusable :-(

: As there are lots of brilliant Atari programs around, and new ones
: come out constantly, I hope we'll be able to surf the chaos of Web
: in near future. Please, hurry up - you there, who have the skills!
: The first fully reliable WWW-browser _will_ be a hit in Atari
: community =) ! Perhaps CAB will be the one, soon?

CAB is a incredible piece of software! It's the networking parts that are
unstable (Esp. under STiK), but it's getting better for every new release.

3432. MultiTech MT2834ZDXK V34 modem

Newsgroup: comp.sys.atari.st
Date: 1996-02-18 00:00:00 UTC
From: dbrewood@nest.demon.co.uk
Message-ID: <6907dbrewood@nest.demon.co.uk>
Source record: 150259

I've just purchased one of the above (UK) modems, and have experienced holy hell in getting the modem working for my comms usages.

I'm using the modem conneced to two machines, the main machine is my Falcon and that is used to access Demon (internet provider) and CIX. The second machine is my Mega ST4 used as the NeST mail server.

The modem has been set to use a default serial rate (from the computer of 38400), to match the speed upgrade modification on the Mega ST4.

The Falcon has been set up using HSMODA06 (DRVIN & SCC) to use 57600bps via the CPX being set to 134.

The modem seems fine here and adjusts to using the 57600bps rate even though set internally to 38400bps.

As to operation, CIX access seems to go well, with rates of 3200bps being observed, so no worries here.

Accessing Demon goes well enough, but cps rate is varying between 440 and 1120 cps, presumably due not to the modems abilities, but down to the feed rate of the news server. Is this correct though? STARTUP.NOS has been set to use a baud rate of 134 (57600bps).

The real problem comes in when switching over to using the Mega ST4 (38400 serial speed - locked). HSMODA06 (MFP) has been set to allow higher speeds and Semper has been told to use a rate of 57600bps as I have been informed that there are internal problems with selecting 38400bps. Most connects go ok, but there are connections where just garbage is received:

```

From: apb25@thor.cam.ac.uk
Message-ID: <4g7fr9$dv0@lyra.csx.cam.ac.uk>
Source record: 150260

First of all, thanks to Claus for the program!

After about half an hour of messing around with boot disks, here is a
short explanation of how to install it (I have an STe with ICD Link II):

Copy CBHD.PRG to C:\CBHD.SYS.
Run CBHDCONF.PRG and "laden.."(right hand menu)
select C:\CBHD.SYS
Select "install...." (right hand menu)
A list comes up (with four names on mine). Select the first one
Reset!

This puts CBHD on C drive so it works. You can put it on another
partition I am sure.

What is the advantages/disadvantages of CBHD compared with ICD?
I know CBHD supports background stuff and bus arbitration (if I decoded
the manual correctly). It is probably better supported than ICD too.

Personally I don't need the bus-arbitration for my HD, and IIRC Magic is
the only program that uses background DMA transfers.

>causing any conflicts.
HSMODEM does not work with TOS 2.05, it speeds up data throughput, but
as it doesn't fix the flow control bugs, then it is of no use !.....

Has anyone seen anything from me in here in the past 2 weeks?

3437. Re: Falcon - tell me more

Newsgroup: comp.sys.atari.st
Date: 1996-02-18 00:00:00 UTC
From: Katherine L Ellis <kellis@mtholyoke.edu>
Message-ID: <Pine.ULT.3.91.960218122646.5643B-100000@mhc.mtholyoke.edu>
Source record: 150264

Hi, yes the falcon is a great machine
* You can plug every monitor you want(old sm124, pc monitor
every new brand, every size)
* Basically ,the falcon on a svga(640*480 in 256) max
On a tv(640*480 in True colors)
And still have every smaller resolution for compatibility.
You can also hook up the screen blaster for $99 and get
super resolution like 1024*768 in 256 colors depending
the monitor.
* The latest tos version is 4.04
System Architecture
-Motorola 68030-CPU at 16Mhz (it sounds slow but the
68xxx are very efficients and even at this speed
it's faster than most PC) because the system is
very light instead windows xx. Like the internal
architecture.
-32 bit data and address bus structure.
-512KB internal tos rom
* Digital signal Processor
-Motorola DSP 56K, operating at 32Mhz
-29-pin external DSP port
* Sound
16 bit stereo A/D, D/A converter with 1 bit DAC bitstream
Eight 16 bit digital audio DMA record and playback channels
with up to 50 khz sampling rate.
Sound DMA coprocessor
Line level (maximum level +4dbm)
*System Ports
Midi in and Midi out, 5 pin DINs
DSP port for external clock, or fa8 etc..(you can plug
8 tracks stereo in this interface, it's eight analog cinch
outputs with 16 bit precision (20 Hz to 20 khz)
Mini stereo plug line inp and outp
Scsi2 port
Bi directional parallel printer port
RS 232c serial port.
RS 422 Compliant LAN port.
Two 9-pin joystick connectors.

Take a look at Falcon MK II c-lab they're really cheap.
Brand new MK II, 4 MB RAM, 350MB SCSI internal... $1349
% , % , 530MB % ... $1499
The price come from Toad computer.
The Falcon MK series are the newest, and they're build

in Germany , and they are the same than the usual Falcon
but they're better because c-lab re-design them for the
sound system.
I can suggest you to command a catalog from Toad computer
E-mail them: info@toad.net

There exists something which works inside wordplus; it`s PD. I have seen it in the catalog of the dutch ACN [Atari Club Nederland]. I don`t beleive it was a .FNT. More something what changed something inside the memory.

Thanks for your help!

Yes, I've removed all the autoboot progs and accs, and tested with and
without HS-Modem, but nothing seems to help...

The weird part here is that the problem seems to be with STiK, as IRC
doesn't work either. In most cases CAB has caused the problems --
especially it's cache. I'll try something stupid now: I'm going to test
some older version of STiK. Can't really believe it could help, but I've
got to try SOMETHING..;)

Surely all applications do that, otherwise they wouldn't work on the
Falcon properly? What is needed, and doesn't exist, is some way for
an application to reconfigure on the fly.

>Somebody else care to explain the mechanics of a MultiTOS resolution
>change? Are processes just stopped and restarted or is there a
>resolution change message and associated responses?

There is a res change message, to tell your program to shutdown. What
there isn't, or at least not documented, is any way for it to start
up again automatically.

If you are writing a program for multitos, you should register that
you are interested in shutdown and res change messages (one of the
many new modes of appl_write()) and when you receive such a message,
you either shut down and then tell the AES you have done so, or tell
it to cancel the shutdown, (possibly prompting the user with a
save|quit|cancel alert to decide which to do)

Theoretically there's no reason why not, but the way GEM was actually written,
you can't. Surely the whole point of GEM programs is that they shouldn't care
what resolution they're written in though?

Try running Telnet or Forecast. I know they might not be of much use to you but the IRC program is nothing to base an opinion on. If both telnet and Forecast don't work for you then there is a serious conflict going on somewhere.

3446. Trubo 16 help

Newsgroup: comp.sys.atari.st
Date: 1996-02-18 00:00:00 UTC
From: rwhit@edenbbs.com
Message-ID: <824734716_OASIS_@edenbbs.com>
Source record: 150273

Well I have had a turbo 16 unit installed for about 3 yrs now.
Since installing it I have never been able to use spectrum 512 to
view spectrum pictures. The spectrum program just gives my a garbage
flickering screen.

I had heard that there was a chip / fix or something available
but Fast tech never returned any of my phone calls and I kinda
gave up try to purchase this fix.

Now I would like to use spectrum again as I recall it does a good job with
gifs.

Does anyone out there now how to fix this or have the info on the chip or
mod to the turbo16 ?

Thanks,
Bob

Forget Spectrum and try either Speed of Light (spoflt38.zip) or
Photochrome(pchrome4.zip), one of the two should work for you. They can
do the same tricks and more.

Not sure, but I believe that the Spectrum (and PhotoChrome) formats
are directly tied to the 8mhz speed of stock ST's...(its how they
"synch") So I think you will have to downshift the speed of your Turbo
16 down to 8mhz...I believe that the Turbo 16 comes with software to
do that, right? Hope this helps! :)

>later with the root directory list
>

After reading this posting, I went away and tried again. This was the
result:

1 - The OPEN box is greyed out and remains so

2 - I enter src.doc.ic.ac.uk into the server dialogue and press return

3 - I get a crash and returned to desktop.

4 - STiK remains connected

5 - I guess (though didn't confirm, but from experience.....) that on
reloading the ftp prog., pressing return at the server dialogue would
result in a stuck bee, from which I can only re-boot.

Any clues here?

Andrew

Message-ID: <824704212_OASIS_@ajrose.demon.co.uk>
Source record: 150279

In article <824661592_OASIS_@swampdog.demon.co.uk>
guy@swampdog.demon.co.uk (Guy Harrison) said:-

>I'm in the middle it seems. Vitually all the time Cab and Magic 2.0
>work fine together but on the odd occasions it persistently crashes on
>the same byte count whilst fetching something it can be persuaded to
>work by turning pre-emptive multitasking off.

Hmm....I just tried this, Guy, in the hope I'd solve the problem. Result?
With a URL I hadn't tried before, 3 bombs (!), mind you it gave this with
preemptive multitasking on and off, so not sure what's going on there.
With a URL I had tried before, back to the old two bombs I know and loathe
so well :-(

So there's 4 phonecalls down the drain with CAB/STiK. It's a real shame
cos I'd love to spend more time using the web, but when the program's so
unstable what can you do? Some days it's OK-ish, but I've more or less
given up on it ATM. Let's hope the next incarnation (about time?) has done
something towards fixing stability - I'm happy with the features remaining
as they are for the moment, if only I could feel the damn thing would stay
up and running on me for more than 5 minutes....or when I really want it
to work!!!

Andrew, on a frustrating Sunday morning in South London.

From: kwestend@one.net
Message-ID: <4g8cen$g5f@news.one.net>
Source record: 150280

I am posting this for my brother who still uses his Atari ST. He
recently got hooked on a rather old game, Dungeon Master. He got the
computer second hand and the software came without any documentation.
He has gotten pretty far, but he thinks that he cannot get any further
unless he can learn how to do magic. Alas, with no docs he is stuck.
Does anyone know where to find out how to perform magic in this game?
Or does anyone know where to look to find this out. He has no
Internet connection, so he asked me to look around for him.

Any help would be more than appreciated...

Kevin

its not that bad ... and not that much slower than imagecopy (if at all)

and has one big advantage over imagecopy .. a far more flexible and powerful
rastering and dithering setup which yeilds some pretty impressive results when
run in lowly 16 colour modes

Theres an archie server if you telnet to src.doc.ic.ac.uk, It does
have restrictions on it but I think it's open to Europe. Anyway keep
your eyes open here as someone asked me this question shortly after
AW10 came out and I posted the reply, it's on ftp.uni-paderborn.de I
can't remember the directory but it's called udo4etos.tos.

Odd that you mention it, because just today, or I just noticed it today,
CAB was doing what you say: it would download the image, but when displayed
on the screen, it was cut right in half. It happened to me on several sites.
I hadn't noticed this behaviour before, but for what it's worth: Falcon
in 256 colour mode, MiNTnet and the MiNTnet CAB.OVL. S

>Claes

Claes, you should be paid by Steinberg as an excellent ambassador for
CAF!

Your figures are of course accurate but as a rough guide to actual
useage of disk space, My 1 gig drive has audio data for 10 songs on it
at the moment.

The songs are all between 3 - 5 minutes long and audio parts are for
vocals, backing vocals, guitars and basses. If you are short of space,
there are a few ways to minimise your storage requirements:

If a part is repeated, use only a short section of audio and copy that
part.

Mix down say 5 or 6 (or any number up to 14) seperate parts into one
(mono) or two (stereo) tracks

Carefully define the active segments of your audio tracks and then
erase the unused portions. On something like a one take vocal track,

this can often shrink the file to 70 or 80 % of it's size.

>* A fast hard drive is essential, as well as a NON CALIBRATING drive.

I know that so called AV or non calibrating drives are recommended
for CAF but, since the upgrade to version 2.xx, I don't think this is
so critical.

My main drive is an IBM OEM 0662S12 which is NOT an AV drive but I get
no SCSI timeout errors or HD too slow errors. (I used to get the
errors regularly in version 1.)

It's a great program on the Falcon. I can't sing it's praises enough.

Cheers

>
>Rod

I've had SL for a couple of years now and can unreservedly recommend
it.

After a fairly steep learning curve, it is easy to use and gives great
results. It is one of the few DTP packages to be COMPLETELY wysiwyg
and has more features than you would believe. Printer output is fast
and furious and it will run on your Falcon in 2,16 or 256 colour mode.
Dithering of truecolour images while in 256 colour mode is handled
very well, giving you a good idea of what things will look like.

If you are going to do a lot involving large truecolour images, you
will need more than 4 meg ram - although Calamus has it's own virtual
memory system, if there is not enough room in real ram for the module
currently running + it's data then it won't work. You will have this
problem for example when trying to import targa files < 900k if you
have only 4 meg. (You can still do this using something like Outside
though)

The last update I have is the October '94 one. There was a late '96
update and I believe that another new update will appear in time for
this year's Cebit show.

If you need anything more specific, just ask.

Cheers

Ed.

: I may be a new Falcon owner so I would like to know something about its
: specifications and other stuff like:
: - I've heard a lot about audio recording using Falcon (on a hard disk),
: but where do you plug in and out all the audio channels ?

It has its own stereo in/outputs, but professionals use separate extension
modules that can handle e.g. 8 tracks simultaneously.

: - Can I attach a standard PC monitor on ?

Yes

: - resolution and colours in all combinations

Standard: about 762x568x16, 62 hz NI with Blow-Up screen driver
(demo version works pretty well)
With Blow-Up hardware screen enhancer: e.g. 816x608x256, 65 hz NI
or 1024x768x16 70 hz NI. With FX-Card: also 680x480x65.000 60hz NI
(the figures may not be exact, but close enough I hope..)
With NOVA graphics card: EVERYTHING =) ! E.g. very fast 800x600
x16 million colours, or amazing 256 color resolutions....

: - I guess it comes with HD floppy (Y/N) ?

Yes

: - CPU speed (your opinion) ?

Originally barely adequate... With cheap FX extension card, quite nice =) !
With 68040-card Afterburner.... Well, VERY nice.

: - You name it.

With FX-card and a separate keyboard, a _very_ good computer.

But: Falcon _needs_ these, fortunately pretty cheap, extensions IMHO..

NVDI 3 or 4 is a must, too - as it is in every Atari, I think.

Go for Falcon, unless you have a very good reason not to..

Greetings,
Tommi

Hang on a sec!

I _never_ even mentioned SED. The CBHD I was talking about was from an archive called CBHD454.TOS which was issued through the Atari files distribution network known as FAN.

This is a FTN technology network which I collect on my BBS with a few other things.

I was attempting to try out CBHD and ran into a few problems as I don't speak any German. There was _no_ CBHD.SYS file in this package.

Where can one get the full "official" CBHD package?

.. Nothing's so weird that no one's done it.

Yes I am running Neodesk 3.02 However I found and fixed my problem! :-)
I was in the environment PATH settings.
I added the Path to my STiK and CAB drive and voila! It fixed it.
However (again) It CAB seems to be more crash happy when run from Neodesk

Anyway thanks for helping. When you said it worked I had to find out why mine
didnt.

phil4@phil4.demon.co.uk (Phil Hough) inquired desperately:

PH> Does anyone know of a PD ascii guide to using RSC files in GFA
PH> Basic ??? I've looked at a couple of example progs, and it
PH> looks _very_ complicated, so I need some help. Any
PH> suggestions ????

Here is one, probably not at all what you need: check out TLC_RSC.prg, on the tlc utilities disk. I just read the doc file, and what the prg does is to make code from a rsc file that you can then embed in the gfa basic program you are writing. Might be helpful to you. TLC Utilities are still available - see the Atari email list; sorry, but I can't seem to find mine. Tom Hayslett sold TLC to an American with IIRC a Polish (pardon!) surname. Jeff Wisniewski? (What do you do when both organic and digital memory fail?)

Here is another one, even less likely to help you: my son and I played around with a program that would make dialog boxes with really stupid buttons to click. Can't remember the name, where it is, or anything else. ST Format, 6 months ago? Seems to me that what it would save were .rsc files.

"The Poor Deluded Soul" - tderrick@acpu.com

Andrew Rose (andrew@ajrose.demon.co.uk) wrote:
:
: Doesn't like MagiC either - single or multi-tasking mode. This seems like
: a major oversight given the way things are going - I mean, if it'll run
: under Magic the author can be sure just about anyone can use it, but if it
: doesn't run unless you've had to make specific alterations to the set-up
: of certain TOS-based computers it's surely asking for trouble.

I did get it to run on my Geneva/Neodesk setup. The first ftp site I tried didn't work at all (I tried to anonymously ftp from two ftp servers, hensa and umich). But I was able to log on to my local shell account and view my directories. I was able to navigate the directories and select an item to download. Downloading brought up a dialogue with a progress bar that slowly colored in, and told me how big the file was and how much I had downloaded, etc... Anyway, it looked like I had successfully downloaded the file, I logged off, etc... and later when I looked at the file on my HD it was actually zero bytes long. Apparently the ftp program never actually wrote it out after downloading it.

: Personally I'd like to be able to load and configure before activating
: STiK. Presumeably this is possible by enabling but not dialling, but
: surely the ability to load and have a look around before doing anything
: specific would be useful.

I tried this and it worked. As long as the STiK accessory is active the program will let you play around in it, you don't actually have to be on line.

The program still seems to be in a beta version. It will need some more work before it is going to be useful to most people. But it is nice to see development on the STiK suite of programs continue!

I was wrong about the IRC: It seems to work OK first, connects to the proper IRC server etc., but when a bit more text is received from the IRC server, IRC just dumps me out. I can`t see any bombs anywhere (!!! ;), but this is probably because IRC isn`t a GEM program. So, is the problem with STiK now..? Any ideas?

I may be a new Falcon owner so I would like to know something about its specifications and other stuff like:
- I've heard a lot about audio recording using Falcon (on a hard disk), but where do you plug in and out all the audio channels ?
- Can I attach a standard PC monitor on ?
- resolution and colours in all combinations
- all interfaces
- TOS version
- I guess it comes with HD floppy (Y/N) ?
- CPU speed (your opinion) ?
- You name it.

Thanks

: >

ARABESQUE II is actually a PC Corel Draw -clone, looks like it, and even
functions like it =) ! It's a full-color program (16.7 M colors supported),
and it loads & saves at least EPS/AI-, CVG (color), GEM- and soon also
Corel Draw's native CDR-files. It's a joy to use, looks great, uses fully
Speedo/True Type/Type 1 fonts with NVDI 3/4 or Speedo GDOS 5, and seems
to be THE vector graphics program for Atari...

This isn't the same Arabesque many of you know - the black & white
vector/raster program. This is compatible to the "old" Arabesque,
but it's from a different planet otherwise ;-).

Distributor: No! from Germany. The same firm that makes THAT's WRITE !

Better than DA's Vector Pro? Well... hard to say. But a lot more
compatible, versatile, and easier to use.

Tommi

: >Calamus SL) in Germany are making a new multi-platform DTP system.
: >I wish I knew more... But that firm _really_ knows what they are doing!
:
: I'm crazy with joy, I just hope it comes out soon :-)

We all do =) !

: I use a 300 DPI LJ4L with resolution enhancement, but I still don't think
: Calamus at small point sizes beats Speedo or even good GDOS fonts at the
: same sizes. Though once you go above 14 point, the CFN quality is fine.

You're right: Calamus doesn't beat Speedo output in ordinary home use,
at least when we use 300 dpi. Still, I don't think it's noticeably worse,
either... And Speedo _is_ VERY good, let's not forget that =) !

: I have used all sorts of CFN fonts, including some *commercial* quality
: ones, and I still think they are not so good. But, you probably have some
: better ones and can get better output. I did think I would see a big
: improvement when I went from a DJ500 to the LJ4L, but there was hardly any
: difference IMO.

The quality of CFN-fonts seems to vary a lot... Some commercial ones
aren't that good, while many are excellent. My DeskJet 660C seems to
make fantastic results with both Calamus and Speedo-system.
Well, fantastic compared to what inkjet-results used to be..

: To my mind, the biggest problem with many CFN fonts is their poor kerning.
: I used to spend hours manually kerning my text just to get a decent look.
: But I find that Speedo and GDOS fonts don't need anything like as much
: kerning to make them look better. Just the occasional pairs, or when the
: point size is very big :-)

Most PD/SW-fonts suffer from this, I think. Some commercial ones do, also.
Still, when you use a high-quality CFN-font in Calamus SL, you'll get
unbeatable results and excellent kerning.

: Anyway, I still use Calamus a lot, and I like the program, so I guess it's
: a case of "horses for courses" this time :-) And one very important fact
: is that CFNs are easier and a lot cheaper to obtain than Speedo fonts ;-)

True =)

Cheerio,
Tommi

And even if you *had* found an interface-card, where would you have
put the drive ? On top of the SIMM's there is no place, mind you.

>I ended up getting hold of a used 'ICD Link II' and a used SCSI harddisk
>inside an external case with power supply for my own use.
>Apart from saving money on the case/power supply by installing an IDE
>drive I felt that having all of it installed *inside* the machine
>would be a neater alternative instead of an extra box/cables.

While this is all true I think that you might underestimate the
problems involving in fitting a (any) Harddisk inside most ST's.

The 520 STs' powersupply is too weak to drive a harddisk.
The room inside a 1040 leaves no space to put a 3,5" HD inside
unless you look around for an alternative housing for your ST or
leave the top off. That leaves us with the Mega's as only models to
build a 3,5" harddisk in. Furthermore, the IDE-TOS card is, in most
cases, too big if you have already built in other cards, notably
accelerators, PC-emulators, videocards and some types of RAM-expanders.

So, MegaST-owners might try this, but the 1040 leaves only space for a
2,5" IDE harddisk. That works fine from my own experience, but bear in
mind that those smaller 2,5" drives are almost twice as expensive for
a given capacity than their 3,5" brothers. That surely takes care of
the price-difference you calculated...

Also, soldering a 40-wire cable or adapter converting from 3,5" to 2,5"
is something I could do without. (Admittedly because I am not doing this
in my own time, but have to charge money for every minute I work.)
Finding a way to mount the drive safely is another difficult point.
That is, *I* could never fix any harddisk with either adhesive tape
or glue. Aaarghh, just the thought of it.
People who like Meccano will *love* this part though...

Last but not least, powersupplies of STs tend to overheat even with
the slightest increase of powerconsumption. They are rated at about
25,8 W up to 39,2 W (when omitting 520's or MegaSTE's) and that is
very limited power by all standards. The last thing I would want to do
is overload it when there are other solutions, ie. using external SCSI.

>So, there you have it, now you be the judge.
>

Indeed.

I think for starters an obvious thing to do would be to get stik running as it
was intended - ie with the dial.scr etc properly setup. Then, if things still
don't work I think you should try HSMODEM. I only got it working with HSmodem
installed, not any other way.

Source record: 150344

I also had a lot of trouble with Stik/CAB when setting up recently. I'm on a Falcon btw.

I discovered the main thing that affected it was what I had in the auto folder concerning serial patches. I think your best bet is to remove anything other than HSMODEM. Thats what I've got in there now, and everything works fine. You could even try temporarily removing that and running Cab, and see if that makes a difference.

Hope this helps a bit. Tim

Source record: 150345

I've just purchased one of the above (UK) modems, and have experienced holy hell in getting the modem working for my comms usages.

I'm using the modem conneced to two machines, the main machine is my Falcon and that is used to access Demon (internet provider) and CIX. The second machine is my Mega ST4 used as the NeST mail server.

The modem has been set to use a default serial rate (from the computer of 38400), to match the speed upgrade modification on the Mega ST4.

The Falcon has been set up using HSMODA06 (DRVIN & SCC) to use 57600bps via the CPX being set to 134.

The modem seems fine here and adjusts to using the 57600bps rate even though set internally to 38400bps.

As to operation, CIX access seems to go well, with rates of 3200bps being observed, so no worries here.

Accessing Demon goes well enough, but cps rate is varying between 440 and 1120 cps, presumably due not to the modems abilities, but down to the feed rate of the news server. Is this correct though? STARTUP.NOS has been set to use a baud rate of 134 (57600bps).

The real problem comes in when switching over to using the Mega ST4 (38400 serial speed - locked). HSMODA06 (MFP) has been set to allow higher speeds and Semper has been told to use a rate of 57600bps as I have been informed that there are internal problems with selecting 38400bps. Most connects go ok, but there are connections where just garbage is received:

Too much work on whose behalf?? The OS or the programmer??

g> happens to your desktop accessories? The situation is even worse
g> under multitasking - process A wants resolution A, process B wants
g> resolution B etc.

Yep, that's a good point... something that would be hard to get around :(

g> resolution is (width, height, colour depth) and adapt itself to the
g> current resolution. I believe this slight change of approach allows

So how come all GEM programs don't do that!? Is it hard to do? If so, how come someone doesn't write some "standard" code to do it, that everyone else can patch into their own sources?

m> It's easy. What you can't do is get GEM to work in the new resolution.
m> The only way to do that is to restart it, which is what the desktop's
m> change resoluiton dialogue does.

So there is no way that you could get your program on execution, to check the current resolution and, if wrong, move to the correct resolution "on the hop" as it were?

I understand that it would be impossible to do this nowadays with multi-tasking systems... but wouldn't it have been possible before... in the times when the loading GEM program just displayed it's name at the top of the screen while it loaded?..... couldn't the rez change have been activated then? :|

Hello...

I know that the HENSA FTP site in the UK can be accessed via a terminal program. Are there any other FTP sites in the UK that can also be accessed via a terminal program?

Is there anyone that I can e-mail to obtain this information?

Thanx....

Yup. It's got, for example, AEO.

What you really need to do is go into directory micros/atari and grab 00files
so that you can search for things offline at your leisure - just grab things
as you need them after that.

AS>
AS> What about Speed... is Gemview faster at processing GIFS/JPGS than
AS> Speed Of Light or Picswitch?

Dunno. I just tried SPOFLT v3.7 and it doesn't display properly on my
graphics card and I prefer to use Imagecopy which is about twice the speed on
GIFs but takes 201nger on JPGs (on an unrepresentative sample).

I also ran out of memory (while having over 2Mb free) on a JPG that
uncompressed to 1.4Mb - Imagecopy handled it easily and it also displayed it
without needing a further click. Imagecopy handles more formats as well so
it's just a better choice all round - sorry...

As far as Gemview goes, I never really got to grips with it tbh and I never
got as far as registering it for that reason.

3499. Conner CP30540 compatible with Atari?

Newsgroup: comp.sys.atari.st
Date: 1996-02-19 00:00:00 UTC
From: jules@cs.ruu.nl
Message-ID: <4ga9mj$6d6@krant.cs.ruu.nl>
Source record: 150155
Cross-posted to: comp.sys.atari.st,comp.sys.atari.tech

Hi,

I am looking for a bigger hard disk to upgrade my MSTe/4 and was offered a Conner CP30540. Since I remember that any harddisk connected to an Atari will have to have parity disabled, I was wondering if anybody knew whether that is possible with this drive.

Otherwise, what's the deal with disabling the parity by software from a PC? I remember there was some discussion about this but don't recall the bottom line.

Thanks,

-- Jules

The resource file positioning information is stored as characters not
pixels. Each object is offset so many characters from its parent and
is so many characters high and wide. rsrc_load() issues rsrc_objfix()
(or whatever its name is) which converts these to suitable rasters
using the current system font size. Just to confuse matters more, it
is possible to define a small raster offset from each character
co-ordinate which is applied after the character conversion. This
allows exact positioning at the expense of true independance. Then Gem
selects the pointsize for the text objects.

If you are using icons or images this where you have to deal with them
by a method of your choice. If they are not used then the application
stands a good chance of working anyway because Gem has done all the
work.

>>Somebody else care to explain the mechanics of a MultiTOS resolution

It would have been fairly easy to relaunch the programs but what to do
with them after that? To be of any real use it would have to get each
program back to the state it was in at the time of the change. Even if
you logged all the user operations via a working (and dubious imo)
appl_trecord() what to do if an error crops up?

>If you are writing a program for multitos, you should register that

>you either shut down and then tell the AES you have done so, or tell
>it to cancel the shutdown, (possibly prompting the user with a
>save|quit|cancel alert to decide which to do)

So what happens if an application does not register?

>
>So how come all GEM programs don't do that!?

They should but it is inherent in the Gem design that it can only be
done at startup.

A suitable analogy for the work involved would be for the user of an
STOS program to hit reset halfway through rendering a Falcon 16 colour
image and expect it instantly to come up in truecolour half rendered
with no side-effects.

>Is it hard to do?

No individual part of Gem is hard. Fathoming out how to put all the
bits together is the tricky bit!

>If so, how come someone doesn't write some "standard" code to do it,
>that everyone else can patch into their own sources?

This can't be done for many reasons. For instance, Gem allows you to
create your own objects - how could a third party program patch
something it knows nothing about?

Theoretically the best way to deal with the display is not to! This is the most resolution indepandant you can get because it guarantees your software will work with anything.

Gem stuff I write have as little to do with the display as possible. They get their input from an OBJECT tree and they send their output back out to it again. It is of no concern to the program I am writing that a side effect of making a change to the tree is a visual change on the screen.

>>work by turning pre-emptive multitasking off.
>
>Hmm....I just tried this, Guy, in the hope I'd solve the problem. Result?
>With a URL I hadn't tried before, 3 bombs (!), mind you it gave this with
>preemptive multitasking on and off, so not sure what's going on there.
>With a URL I had tried before, back to the old two bombs I know and loathe
>so well :-(

This is exactly what I do ...

Installation problems ...

Increase ALLOCMEM - I did have it up to 500K but it seems fine at
300K, this reduced some crashes.

I can email you the config's I've got which Flinny sent me - until I
got them I had given up as well.

Ensure the cache "WWWCACHE" is in the ROOT.

Run STiK as a program - it recovers from cockups better (actually
rename it STIK.PRG).

Set up STIK_CFG.DAT even if you don't need it and put it in the same
folder as STIK.PRG - install STIK.PRG with the folder set to its launch
directory so it finds STIK_CFG.DAT.

Turn Cab image display off, have text instead of images and don't let
it get brackgound images.

Solutions for cockups that persist ...

Delete the cache and every single file within it but you may have to
create 00000000.HTM later on if it's being moody and refusing to load
the first page.

Starting it ...

Boot with HSMODEM.

Pre-emptive off.

Run STiK as a program and connect.

Wait for STiK to get its initial disk accesses done.

Run Cab.

Select a page you know downloads reliably and download it again via
reload and keep reloading until it gets it. I use the Langley Air
Force base so if I disappear off the face of the earth one night you
know what's happened to me :-)

Always make sure you have successfully got a page just before you quit
otherwise you may end up having to kill the cache contents again.

I can usually just load Cab again if it bombs.
STiK can terminate with bombs but it's usually ok to just run it
again.
It's usually possible to go through a complete reset and reload StiK
and Cab without dropping the line. Assign them shortcuts to get it
done quick before the demon end drops the line.

>So there's 4 phonecalls down the drain with CAB/STiK. It's a real shame

Does it come up with a blank page and a sad face?

Try hitting "reload" - wait 30 seconds or so then Escape back to the
blank page and the sad face - reload again etc.

BTW, do not try accessing anything on demon. I've got into their web
server once - it's too slow and Cab keeps timing out. Comment out the
two cache server lines if you've got them enabled.

>Let's hope that someone comes up with a easy-to-set-up working WWW program

>>Just a thought...
>
>Thanks for that, any ideas how ??? I only use Basic, so I guess its a
>job of peeks and pokes ??? in which where to and what values ???

```
typedef struct {
ulong c_id, /* cookie id */
c_up; /* cookie user pointer */
} COOKIE;

static void
find_cookie(look_id)
ulong look_id;
{COOKIE *c =(COOKIE*)(*SYS_P_COOKIES);
int i =-1;

while (c && c[++i].c_id) {
if (c[i].c_id == look_id) c[i].c_up = NULL;
}
}

main()
{ulong fpu =/* whatever _FPU is as a longword */
```

```
find_cookie(fpu);
}
```

The cookies are stored in a COOKIE array whose address can be found by reading location $5a0 (SYS_P_COOKIES above). If this is zero then no cookie jar exists. If it not zero, poll them in ascending order until the _FPU cookie identifier (c_id) is found or you reach the end of the list (c_id == 0) then change the user pointer (c_up) to a suitable value. As I have an _FPU cookie installed but no FPU then I assume setting c_up = 0 will disable it because that's the setting I've got.

Sorry it's not in Basic. :-(

3508. Re: Problems with Oasis

Newsgroup: comp.sys.atari.st
Date: 1996-02-19 00:00:00 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <96050.135846STIRRE31@MAINE.MAINE.EDU>
Source record: 150164

Okay, I'm an idiot. I solved my own prolem by downloading Oasis
and re-installing it. I deleted some important folders somehow....
Anyway, my problems are still not done, of course! I cannot
get either pop mail or Netnews working from within Oasis (kinda
important ;-)). I can only send mail through Oasis. The mail
I send comes from MYNAME@SOMEHOST. I thought I'd defined it
differently but I will check. As far as pop mail goes, when I
kick pop (or pop kick) my modem will start grinding away.
However, I never have any mail. I do have the pop mail version
of NOS.TTP. Also, when I put the command "pop mailhost maine.
maine.edu 3" in my STARTUP.NOS file it tells me the command is
not recognized. If I type it, though, it seems to work fine.
Any suggestions? I may post my STARTUP.NOS file in the hopes
that this may get me some help.

3509. XaAES Progress Report

Newsgroup: comp.sys.atari.st
Date: 1996-02-19 00:00:00 UTC
From: "Craig. Graham" <Craig.Graham@ncl.ac.uk>
Message-ID: <4gaoqo$4er@whitbeck.ncl.ac.uk>
Source record: 150165

Just a quick note on how XaAES is progressing.

With a little help from the XaAES mailling list, things have moved on a lot since the first beta 2 weeks ago.

Lot's of GEM programs now run - some well, some not well. A few don't run at all (yet), but those that do include:
o Thing
o Z'Org
o QED
o Lattice C
o Devpac 2 & 3
o TOSWIN (all versions that are currently kicking about)
o CLA
o DUftp
o CAB

None of these run perfectly, but they all work to some extent.

At a more detailled level, the new beta (going out to the mailling list members today) now supports:
o alerts (non-modal, in windows))
o form_do() dialogs (as above)
o mono monitors (a bit)
o shel_write() launching of programs
o all the windowing & stuff that was already there

Still to do are accessories, the desktop root object tree, a fileselector, and various other odds & ends.....

A real release will probably make it out in a couple of monthes time.

Craig.

Hi everyone, I have some questions about some software, which I
have no clue, do I need them ?:
What is tex ?
What is poscript ?
What is GNU ?
What is Gem-dos ?
What is E-mac ?

Also is it possible to emulate a PC 80486 on the Falcon 030?
Because I Know that is possible to emulate a 80286 but it's
pretty old. And the price pretty high. When you know that you
can get a 486 portable packaxx bxxx, second hand for $600.

Thank you , to answer .

Have a look on umich for some files that contain hints/maps/spells.

Probably in the Games section.

There are also some Dungeon Master character editors & even some
level editors available.

Have fun

I've just traded up from my MultiTech modem to the US Robotics Sportster Vi 28.8 fax with personal voice mail. Needless to say I've got a few queries..

1/ Can anyone recommend a fax receive program for use with it and Semper (the ftn mailer) to allows fax's to be received? If so can you recommend the best Semper modem strings to be used with it?

2/ Are there any programs on the Atari that allow the Voicemail capabilites to be accessed?

Looking forward to any replies.

I'm all for any new mags which contain info on the ST, but to be honest, I can't see where you'd be ahead of the 2 current ST mags in the UK. With this in mind, I feel that the ST coverage would be shoved further & further down the list of priorities.

I would certainly buy the first issue or two to see how it goes, assuming a cover price that was low enough in comparison to the Atari-specific or Atari-relevant page count. In other words, I am not going to pay 3 or 4 UK pounds for a few pages of info that may well be repeated once each by the other 2 mags, and once more (up to two months previously) on the net.

I applaud your plans, and would love to see a return to those halcyon days. I don't think it will happen though.

Steph.

>Is there anyone that I can e-mail to obtain this information?

Check out my FTP list which I posted just a few days ago. If you missed it
you can go to the Atari section of my web page (the URL can be found in my
signature) or directly via FTP to:

ftp.sn.no /user/hallvart/atari/info/ftplist.txt

I'm now working on it to get it more up to date, but until then the existing
version will have to do (which isn't that wrong anyway I guess).

There are a few FTP sites in the list which reside in the UK, but you might
as well try other sites (i.e. Germany). ANY FTP site can be accessed via a
terminal program- the sites don't 'detect' if you're using an X-terminal or
a simple VT-100 emulator. I use 'Connect' myself.
Good luck!

Get Fontkit Plus 3/4 by Jeremy Hughes. It allows you to do all sorts of things with printer and screen fonts. Though as you could be converting from 180 DPI fonts to 300 DPI ones, you will have to do a fair bit of tweaking. Therefore it might be worth your while looking out for some 300 DPI GDOS fonts anyway. I have some myself, so they are available, some are commercial/shareware, but there are some PD ones around as well.

Alot of Atari stuff for sale... (I'm still a devoted Atari user:
Cubase Audio Falcon)

buyer pays all shipping costs...

Hardware-----

My second Falcon: 4megs. 85meg IDE, mouse, original Falcon software ,
manuals,adapter for Atari monitors, misc software (ICD Pro SCSI
Driver Utilities), with original box , midi cables, excellent condition:
$675 or offer

STE with 4 megs ram, monochrome monitor, 40meg external Supra HD,
mouse, manual, misc. software, midi cables, excellent condition
$300 or offer

Screen Blaster: resolution enhancement for the Falcon (hardware &
software & manual) $50

US Robotics Sportster external 14,400 fax/modem (no manual but in
original box) works perfectly SALE PENDING

Software-----

Diamond Edge: great diagnostics utilities..... SALE PENDING

Diamond Back II Hard Disc back-up utility $10

Straight Fax 2.0, the best faxing prog ..... SALE PENDING

NVDI 2.5 ..... SALE PENDING

Squish II a HD space saving compression system SALE PENDING

all software original with manuals

>
>Mike White

When us reporters/editors have a certain amount of space to fill, it is vital that we provide enough words, or don't go over a certain amount, whatever the case might be. A word count saves us having to manually count every word (I've done that before), and by accurately knowing how many words we have written, we can stop an unknowing sub-editor from chopping out vital chunks of our text to make it fit a space :-(

A word count (which is quite a simple thing by and large) is an absolute must for anyone doing professional or semi-professional writing. And I think, judging by the other responses in this thread, most people agree that it is a necessity!

When you start writing for a living, you'll soon realise how vital things like spell checkers, word counts and a thesaurus are to help make your stuff worth publishing without the features editor having to spend time cleaning up your efforts.

Hi

A copy of Pagestream 2.02 came with my the S/H ST system I bought last year. But apart from printing out the test page, I haven't really played with it. I've got the manuals (legal copy) and it looks quite good, but the reports of the font problems put me off a bit, though I know if you stick to certain fonts for certain sizes etc then everything works okay.

A contact of mine, now moved onto a Mac, actually used Pagestream purely for PS output, and after a number of problems with Pagestream output, he and the agency that printed the files out, managed to get a working system. Though there were still some problems, I think with crop marks and registration marks, he achieved a reasonable level of success.

I might have to install the program again and see what gives.

3530. Atari SCSI tape system for sale

Newsgroup: comp.sys.atari.st
Date: 1996-02-19 00:00:00 UTC
From: fredu@enterprise.america.com
Message-ID: <4gb7tf$120@enterprise.america.com>
Source record: 150186

I have a homebuilt tape backup system for sale. It uses a Beckmeyer purchased host adapter set to SCSI ID 4 and a 60 meg tape drive, Archive type mechanism. It is housed in an ancient Corvus case and power supply with the side cut away to access the tape drive opening. I just tested it today with the original Becmeyer software and it backed up the 6 meg of my C: partition in somewhat less than 15 minutes. I don't know exactly how long as I left the room for that time. The unit is limited to 60 meg per tape and will handle more than one tape per partition as well as more than one partition per tape, according to Beckmeyer.

The mechanism probably can be replaced with any other SCSI drive, but I cannot warrant that with any certainty.

I have a jpeg of the box, about 20K, for interested parties. All offers are acceptable.

3531. SCSI HD system or parts for sale

Newsgroup: comp.sys.atari.st
Date: 1996-02-19 00:00:00 UTC
From: fredu@enterprise.america.com
Message-ID: <4gb8ac$1b7@enterprise.america.com>
Source record: 150187

I have an ICD ADSCSI host adapter, a host adapter mounting bracket, a Digital RD54 case and power supply and a 40 meg IBM SCSI hard drive to offer up for sale. All of the above have been tested together to work just fine. They are not at present assembled in any manner as there are no firm mounting points in the case for this type of installation. I used it with some foam padding to hold stuff from damage while in use. The lazy way out, but it still works.

Also included in the above is an 80 meg maxtor drive that probably will work, once the jumper settings are figured out.

I have a jpeg of 20K of the case and power supply for interested parties. Make any offers of all of the above, not really going to be parted out unless I can sell it all in one short period of time.

I will soon be moving and am wondering whether I should investigate parking my Quantum Maverick (540 meg) hard disk which is mounted in an ICD FA*ST box. I tried using the park program (.TOS) that is part of the ICD package, but it just froze up my system (1040 STfm, TOS 1.04).

Any guidance on this matter would be appreciated.

: sound crazy but believe it or not it worked great for me. Pick the unit up.
: hold it about 6 inches above its desk and drop it. Worked for me. No
: guarantees but its worth a try right.

I also used that method and felt there had to be a better solution. My
answer was to remove the large socketed chips, perhaps the mmu and glue
chips. These are the square chips with the "finger looking legs" on the
perimeter. The fix I used was to gently bend up the corresponding
contacts within the socket with a straight pin bent into a hook.

just another opinion

Internet. I want to try it. But it sure is tough to understand! My little town finally got a local service provider. They offer SLIP & PPP. I have a copy of WWW116, and others I guess. (CD-ROMs are great, but hard to keep track of all the software one has!) There is also one local MS/DOS BBS (I did mention 'little' town...) Getting this message out requires a long distance call for me.

I read articles (Geneva Review, N/D '95 Current Notes for example) of people accessing the Internet with Stalker, maybe QWK packets through a local provider. Huh? How? I hear of Mint & MultiTOS and programs used with them. Oracle, linyx, ??? What? How? What does one get?

The local service provider starts with the line: Miniumum computer - 486DX 66... Yea. Well. They'll be a lot of help.

What are my options for connecting to the Internet with a TOS machine? There is such a confusing array of info. Can anyone list just the basic options, so I know what options I have, and then I can pick which options would suit me? For example, it seems CAB/STIK offers the whole ball of wax from any SLIP account. But then people talk of Telenet(???), using STalker, PPP accounts with (ah, Mint was it?), etc. I'm drowning! Someone toss a lifeline, & list the modes of accessing the 'Net, and the Atari packages that use those modes, & what one gets from the mode. Please. :)

The ST does not have a real Centronics port. It only implements enough to drive a printer - but not all the extra control lines which PC peripherals use to do data input.

The fact that the ST (and more modern PCs) *can* use their data lines for input is of no real help in getting this sort of equipment to work.

Source record: 150208

If you want to code in C the pure C compiler is just the best.
If you want to code in Pascal the Pure Pascal compiler is again the best.
If you want to code in c/c++ use the gnu c compiler (public domain). Huge,
slow,
but powerfull, and it generates a very good code, and supports GEM prgramming
even in c++ (window classes :-))
If you don't want to spend a lot of money try the hsc distribution of the
sozobon c, it's nice too.

> the only program that uses background DMA transfers.

So far, that's true. MagiC is pretty popular in Germany, though, so this is an important feature. One of the most important advantages: CBHD is free (although the configuration program is shareware). It is a high-performance driver, and its SCSI routines follow the proper SCSI protocol which means that there is a good chance that certain drives will work with CBHD which will not be accessible using other drivers. Bus arbitration is only one aspect of this.

CBHD also has a lot of configuration capabilities (although the current configuration program does not yet offer all of them), so it's pretty flexible.

Please bear in mind that I might be a little biased, though...

> Does anyone know where to find out how to perform magic in this game?

Probably quite a lot - it's an excellent game.

To perform magic, you use the funny symbol things that look like << , a square,... These appear beneath peoples names, i think you have to click on something first though. The first icon you click on selects the strength of the spell, you can then click on upto three symbols, this selects the spell.

IIRC:
1st, 4th will cast a light spell, 2nd, 4th will cast a light spell that lasts longer.

1st, 4th, 4th will cast fireball.
^ ^
| |
fire movement

There are lots of other ones, experiment. Scrolls also tell you some, although I can never remember which symbol des ful, are (although ful is the 4th symbol in the second set).

PageStream? Doesn't use Speedo, and can get a bit slow, but it's
easy to use, and has decent PostScript output.

It's import modules are a bit buggy though :-(

Calamus is very difficult to learn to use properly.
It does not have proper PostScript support, and its colour output
on low resolution devices (eg 300dpi DeskJets) is appalling.
Apart from that, it's OK.

When I used to produce a football fanzine, I used PageStream rather
than Calamus as it was easier to use and I could get better output
by using someone else' PostScript printers. The biggest problem with
using PageStream was that it kept everything in memory at once, Calamus
has its own neat "virtual memory" system.

I suspect that you've downloaded the web page which contains links to
the files instead of downloading the files themselves.

Before you hit 'D' it can be a good investment to type '='. This will
tell you what page you're on and what link you're currently looking at.
If the latter corresponds to the the file you want to download, use the
cursor-left key to back out of the '=' display and then type 'D'.

(Um, I think :>)

I believe devpac 3.1 (hisoft), the best assembler on the atari will take
advantage of the 040..
